

E02-013 Analysis Update

Measurements of G_E^n at High Q^2

Seamus Riordan
Carnegie Mellon University
riordan@jlab.org

for the E02-013 Collaboration

June 12, 2008

Spokespeople:

- ▶ Bogdan Wojtsekhowski - JLab
- ▶ Gordon Cates - University of Virginia
- ▶ Nilanga Liyanage - University of Virginia

Postdocs:

- ▶ Seamus Riordan - Carnegie Mellon University

Ph.D. Students:

- ▶ Sergey Abrahamyan - Yerevan
- ▶ Brandon Craver - University of Virginia
- ▶ Aidan Kelleher - College of William and Mary
- ▶ Jonathan Miller - University of Maryland, College Park
- ▶ Ameya Kolarkar - University of Kentucky

Masters Students:

- ▶ Tim Ngo - California State University, Los Angeles

Outline

- ▶ Introduction
- ▶ E02-013 Overview
- ▶ QE Elastic Selection
- ▶ Identifying Dilution
- ▶ BigBite Tracking
- ▶ Conclusion

Nucleon Form Factors

- ▶ Sachs form factors, $G_{E,M}^{p,n}$, describe EM structure of nucleons
- ▶ Related to electric charge and magnetic moment distribution in Breit frame
- ▶ Are exactly Fourier transforms in non-relativistic limit
- ▶ One-photon approximation:

$$\left. \frac{d\sigma}{d\Omega} \right|_{\text{LAB}} = \frac{\alpha^2 \cos^2 \frac{\theta}{2}}{4E^2 \sin^4 \frac{\theta}{2}} \frac{E'}{E} \left(\frac{G_E^2 + \tau G_M^2}{1 + \tau} + 2\tau G_M^2 \tan^2 \frac{\theta}{2} \right)$$

G_E/G_M through Cross Section Asymmetry

- ▶ G_E^n typically difficult to measure
- ▶ Measure cross section asymmetry for QE $^3\text{He}(\vec{e}, e'n)pp$

$$\begin{aligned} A_{\text{phys}} &= \frac{\sigma_+ - \sigma_-}{\sigma_+ + \sigma_-} \\ &= -\frac{2\sqrt{\tau(\tau+1)} \tan(\theta/2) \Lambda \hat{n} \cdot (\hat{q} \times \hat{T})}{\Lambda^2 + (\tau + 2\tau(1 + \tau) \tan^2(\theta/2))} \\ &\quad - \frac{2\tau\sqrt{1 + \tau + (1 + \tau)^2 \tan^2(\theta/2)} \tan(\theta/2) (\hat{q} \cdot \hat{T})}{\Lambda^2 + (\tau + 2\tau(1 + \tau) \tan^2(\theta/2))} \end{aligned}$$

- ▶ Most sensitive to $\Lambda = G_E/G_M$ when target at 90° to \vec{q}

E02-013 ran in Hall A at TJNAF in Spring 2006

Kin	Q^2 (GeV ²)	E_{beam} (GeV)	Run Time (days)
1	1.3	1.519	8
2	2.4	2.642	19
3	3.5	3.291	33
4	1.7	2.097	9

- ▶ Polarized ^3He target acts as neutron source
- ▶ Two arms to measure coincidence e' and n

- ▶ BigBite - large acceptance spectrometer, measures \vec{e}'
- ▶ Neutron arm - matches BB acceptance, measures neutron momentum through ToF, performs nucleon charge ID

Analysis

Major goals:

- ▶ Provide accurate electron track/momentum reconstruction
- ▶ Reliably separate QE events
- ▶ Identify charge of nucleons
- ▶ Remove contributions from background events

QE Selection

- ▶ Use cuts on:

$$p_{\text{miss},\parallel} = \hat{q} \cdot (\vec{q} - \vec{p}_{\text{NA}}) \quad (1)$$

$$p_{\text{miss},\perp} = |\vec{q} - \vec{p}_{\text{NA}} - \hat{q}p_{\text{miss},\parallel}| \quad (2)$$

$$W^2 = (p_{i,n} + q)^2 \quad (3)$$

$$m_{\text{miss}}^2 = (m_{\text{He}} + \nu - E_{f,n})^2 - p_{\text{miss}}^2 \quad (4)$$

- ▶ For W , assume $p_{i,\text{nucl}}$ is at rest
- ▶ Missing mass, X : ${}^3\text{He}(\vec{e}, e'N)X$

$$Q^2 = 1.7 \text{ GeV}^2$$

$$Q^2 = 3.5 \text{ GeV}^2$$

- ▶ Missing mass of ${}^3\text{He}(\bar{e}, e'n)X$ gives pion production rejection
- ▶ Pion production threshold at $2m_N + m_\pi \sim 2 \text{ GeV}$
- ▶ Sensitive to $p_{\text{miss},\parallel}$ resolution from ToF

Missing Mass vs. $W - Q^2 = 1.7 \text{ GeV}^2$

Missing Mass vs. $W - Q^2 = 3.5 \text{ GeV}^2$

- ▶ Monte Carlo tells remaining contribution from resolution
- ▶ Initial ^3He momentum distribution from R. Schiavilla
- ▶ Using MAID data production cross section are given
- ▶ Resolution effects calculated from H_2
- ▶ Does not include radiative corrections, sophisticated acceptance tests

$$Q^2 = 1.7 \text{ GeV}^2:$$

Data

Simulation

Less agreement at higher $Q^2 = 3.5 \text{ GeV}^2$:

Data

Simulation

Inelastic Contribution with QE Cuts

$$Q^2 = 1.7 \text{ GeV}^2$$

Invariant Mass - Kinematic 4 - All but W cuts

Data

Invariant Mass - π Production Contribution - Kinematic 4

Simulation

$$Q^2 = 3.5 \text{ GeV}^2$$

Invariant Mass - Kinematic 3 - All but W cuts

Data

Invariant Mass - π Production Contribution - Kinematic 3

Simulation

Larger contamination cuts heavily on statistics

Asymmetry for pion production similar to QE asymmetry
MC could evaluate asymmetry contributions

Raw Asymmetry vs Invariant Mass - Kinematic 4

Raw Asymmetry vs Invariant Mass - Kinematic 3

Need to evaluate contributions of:

1. Accidental random background
2. Protons with misidentified charge
3. Scattering from N_2 present in the target
4. Final state interactions

$$A_{\text{phys}} = \frac{A_{\text{raw}} - \frac{\Delta_{\text{back}}}{\Sigma} - \frac{\Delta_p}{\Sigma}}{P_{^3\text{He}} P_n P_{\text{beam}} D_{\text{back}} D_{N_2} D_p D_{\text{FSI}}} \quad (5)$$

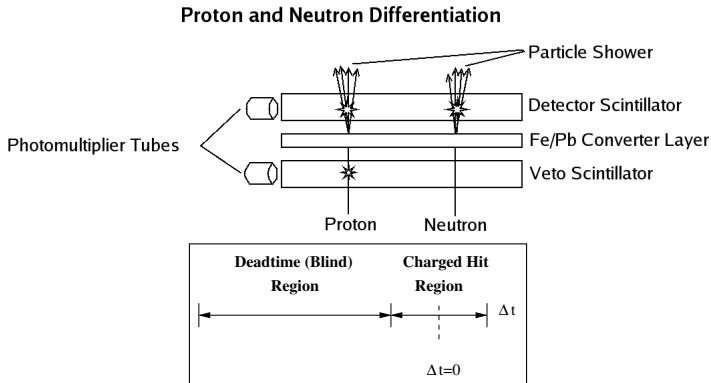

- ▶ Accidental background comes from shifting in time

- ▶ Nitrogen contribution evaluated from N_2 target with same analysis scaled to charge and density (contributes $\sim 5\%$)

Nucleon Charge Identification

Nucleon Charge ID comes from veto scintillators:

Veto amplitude analysis can improve identification

- ▶ Misidentification of protons as neutrons must be understood
- ▶ Use 3 targets to separate “mixing constants”, η :

$$N_b^{(a)} \propto f_{\text{targ}} \sigma_b \eta_b^{(a)}, \quad D_p = \frac{N_n^{(n)}}{N_n^{(n)} + N_p^{(n)}} \quad (6)$$

$$R_{\text{H}_2} = \eta_p^{(n)} / \eta_p^{(p)} \quad (7)$$

$$R_{\text{He}_3} = \frac{\frac{\sigma_n}{\sigma_p} (\eta_n^{(n)} / \eta_p^{(p)}) + (f_{\text{He}_3}^p / f_{\text{He}_3}^n) (\eta_p^{(n)} / \eta_p^{(p)})}{\frac{\sigma_n}{\sigma_p} (\eta_n^{(p)} / \eta_p^{(p)}) + (f_{\text{He}_3}^p / f_{\text{He}_3}^n)} \quad (8)$$

$$R_{\text{N}_2} = \frac{\frac{\sigma_n}{\sigma_p} \eta_n^{(n)} / \eta_p^{(p)} + \eta_p^{(n)} / \eta_p^{(p)}}{\frac{\sigma_n}{\sigma_p} (\eta_n^{(p)} / \eta_p^{(p)}) + 1} \quad (9)$$

Factor ($f_{3\text{He}}^p / f_{3\text{He}}^n$) is p_{miss} dependent:

Density v. Momentum

Momentum Dependence of P_{par} and P_{perp}

Value for our cuts ≈ 2.15

Final State Interactions

Largest nuclear effect comes in the form of charge exchange

Sargsian
arXiv:nucl-th/0110053 and Private Comm.

Preliminary results show systematic decrease in A_{phys} of 5%
More accurate calculations available soon

Tracking

- ▶ New tracking code for BigBite by Ole Hansen available
 - ▶ Provides substantial increase in processing time
 - ▶ Could provide up to 30% increase in statistics
- ▶ Summer undergraduate will work on improving drift chamber resolution

Conclusion

- ▶ G_E^n analysis is moving smoothly
- ▶ Pion production MC and improved tracking will improve statistics at $Q^2 = 3.5 \text{ GeV}^2$ by 50%
- ▶ Analysis on $Q^2 = 1.3$ and 2.4 GeV^2 will begin soon
- ▶ Final results and publication early next year

(Current results will be shown Saturday, 4:30pm)
