

ECAL Energy Resolution

$$\frac{\sigma E}{E} = \frac{p_0}{\sqrt{E}} \oplus p_1 \oplus \frac{p_2}{E}$$

PDG: 34.8.1

- ◆ P0: statistic-related fluctuations: intrinsic shower fluctuations, photoelectron statistics, and sampling fluctuations (4-5% for our shashlik design, which is based on Xiaochao's calculation)
- ◆ P1: detector non-uniformity and calibration uncertainty
- ◆ P2: noise term

Method

e^+ : $E= 0.05 , 0.1 , 0.15, 0.2\dots\dots, \text{ and } 7 \text{ GeV}$

Total shower deposit energy: totEdep

7-module configuration

PVDIS Configuration and $\theta_e=25^\circ$ Simulation Results

EC energy resolution

Summary

- For the 7-module configuration, positrons without any field straightly hit on the front of ECAL.

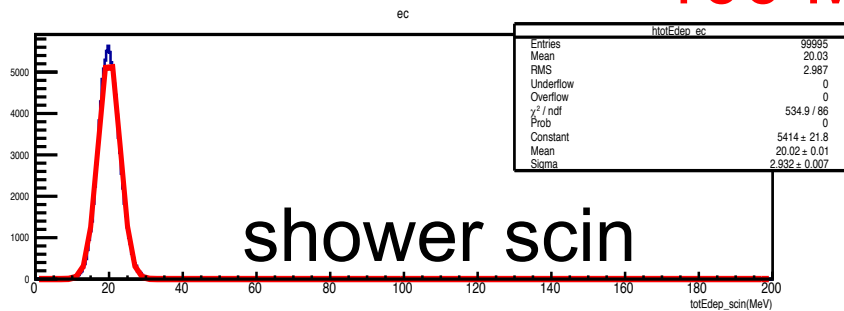

χ^2 / ndf	333.8 / 14
Prob	0
p0	$0.03994 \pm 5.584\text{e-}05$
p1	0 ± 0.0002934
p2	$0.007974 \pm 4.864\text{e-}05$

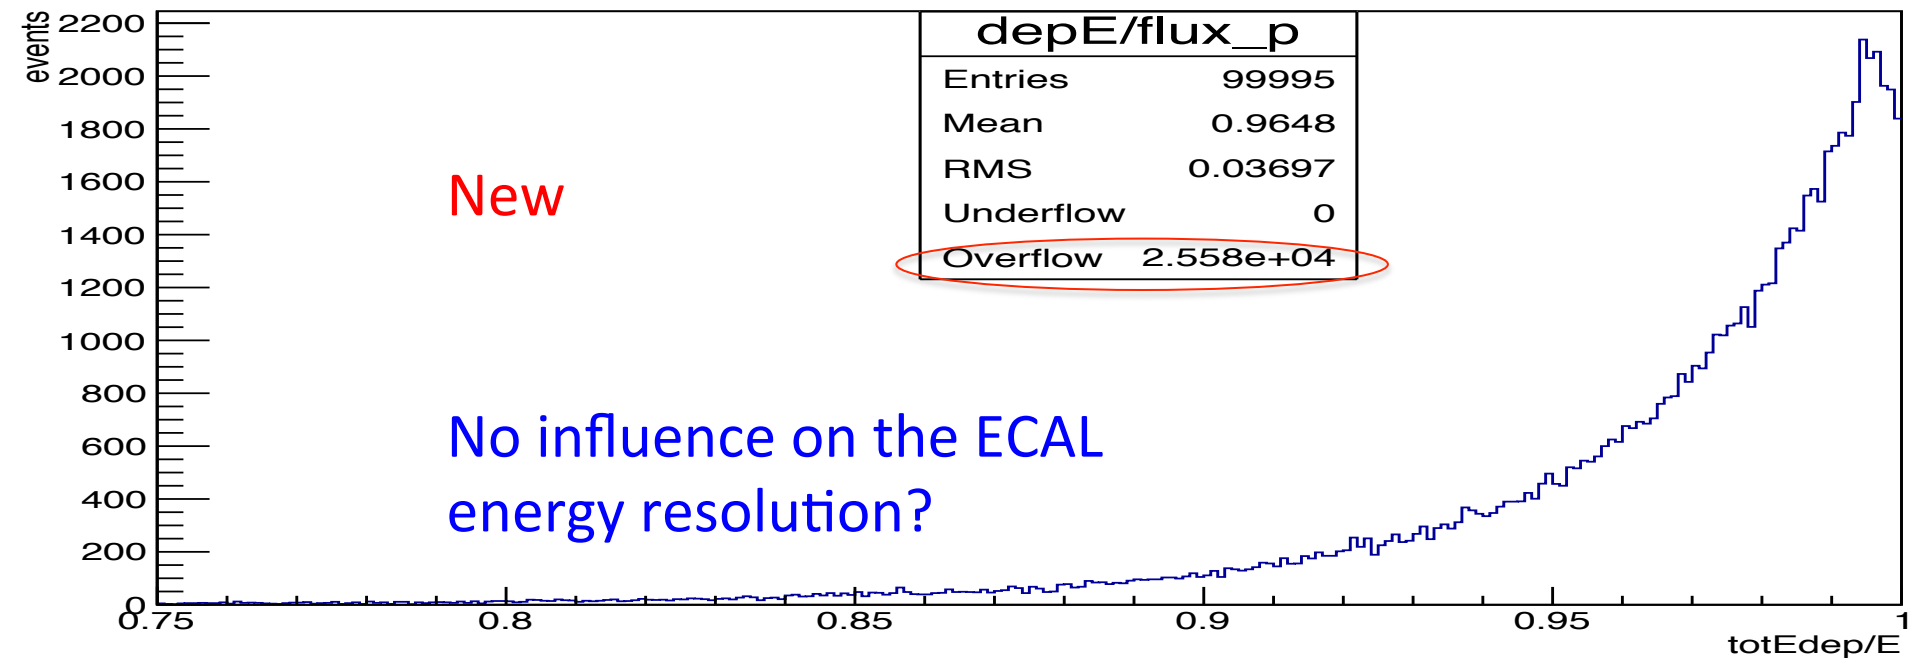

- For the PVDIS configuration, electrons with field with $\theta=25^\circ$ hit on the front of ECAL.

χ^2 / ndf	129.7 / 6
Prob	$1.492\text{e-}25$
p0	0.05131 ± 0.007546
p1	0 ± 16.88
p2	0.04792 ± 0.0007579

Momentum Fraction Deposit in ECAL

100 MeV/c, e+

Next Step

- Figure out the over summed ECLA deposit energy in the GEMC simulation package.

- 
- ❖ Check out the ECAL deposit energy in each scintillator layer.
 - ❖ Figure out how does the GEMC add deposit energy together.

Any comments and suggestions ?
