

Update on LHR^S Pion Rejector Calibration

Melissa Cummings

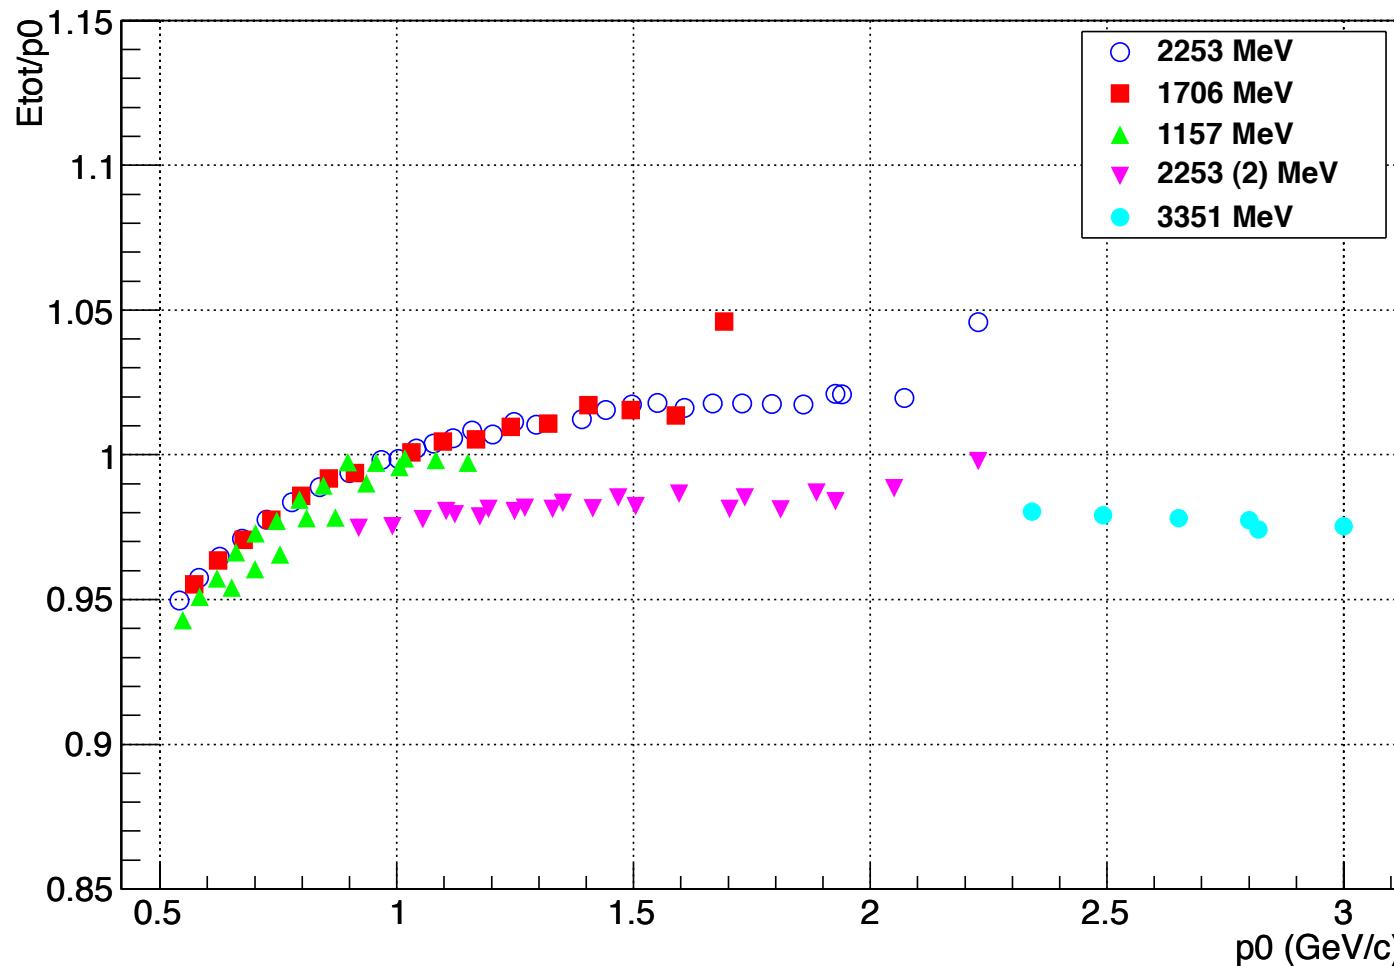

10/23/12

Method 1: 90/10 Split

- Align peaks in layer 1 (2) so that 90% (10%) of total energy is deposited in that layer
- ~1 GeV run used to optimize calibration coefficients
 - assume full energy deposition

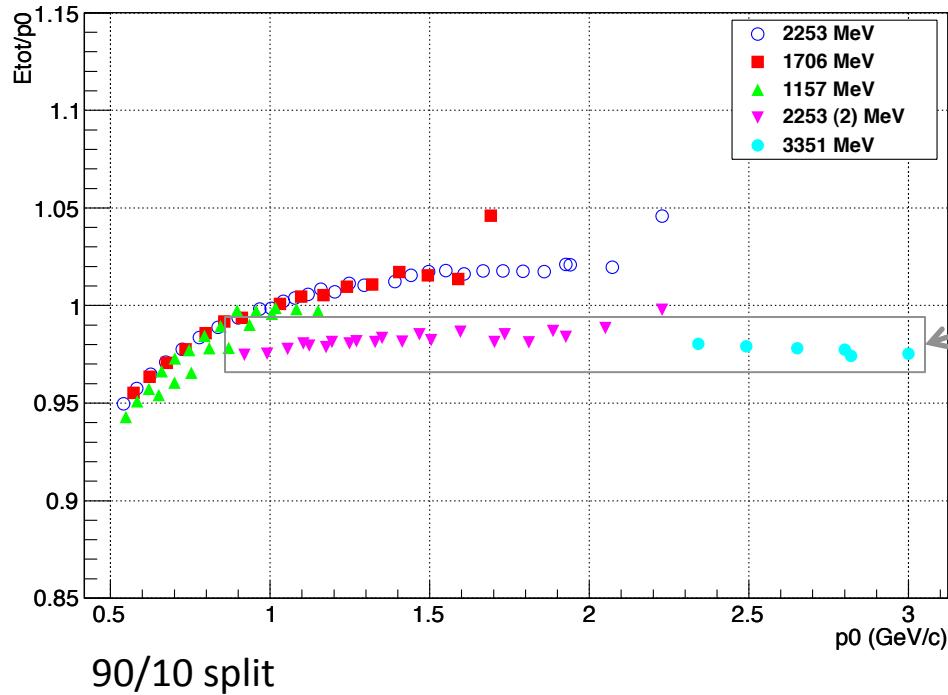

Method 1: 90/10 Split

LHRS Pion Rejector Calibration Stability Check

Questions

LHRS Pion Rejector Calibration Stability Check

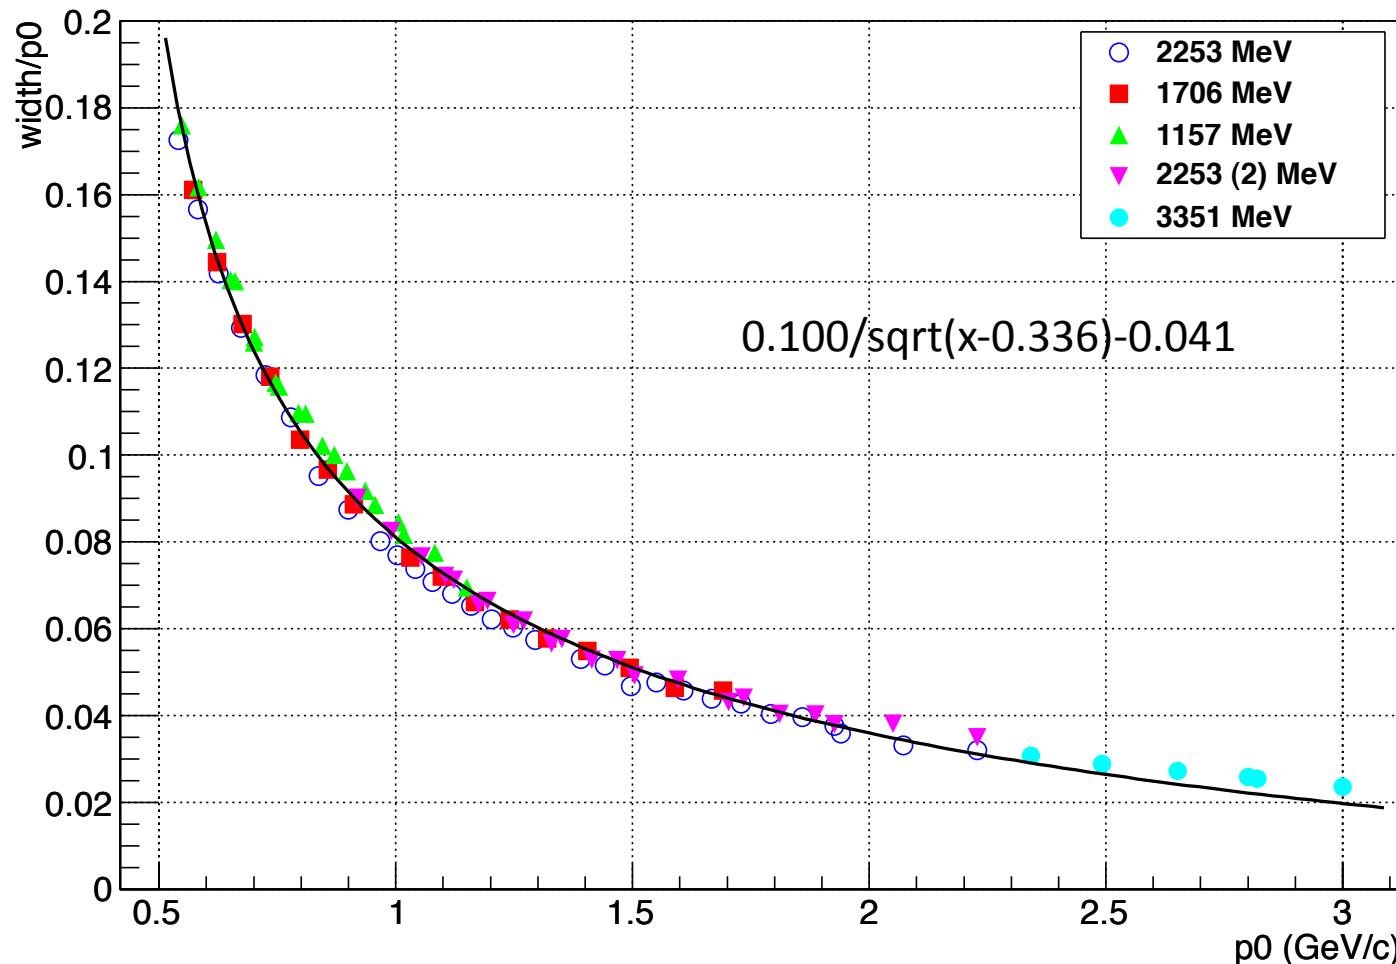

Why is calibration not consistent for 2.2 (2) and 3.3 GeV?

Check tracking variables?

Method 1: 90/10 Split

LHRS Pion Rejector Resolution

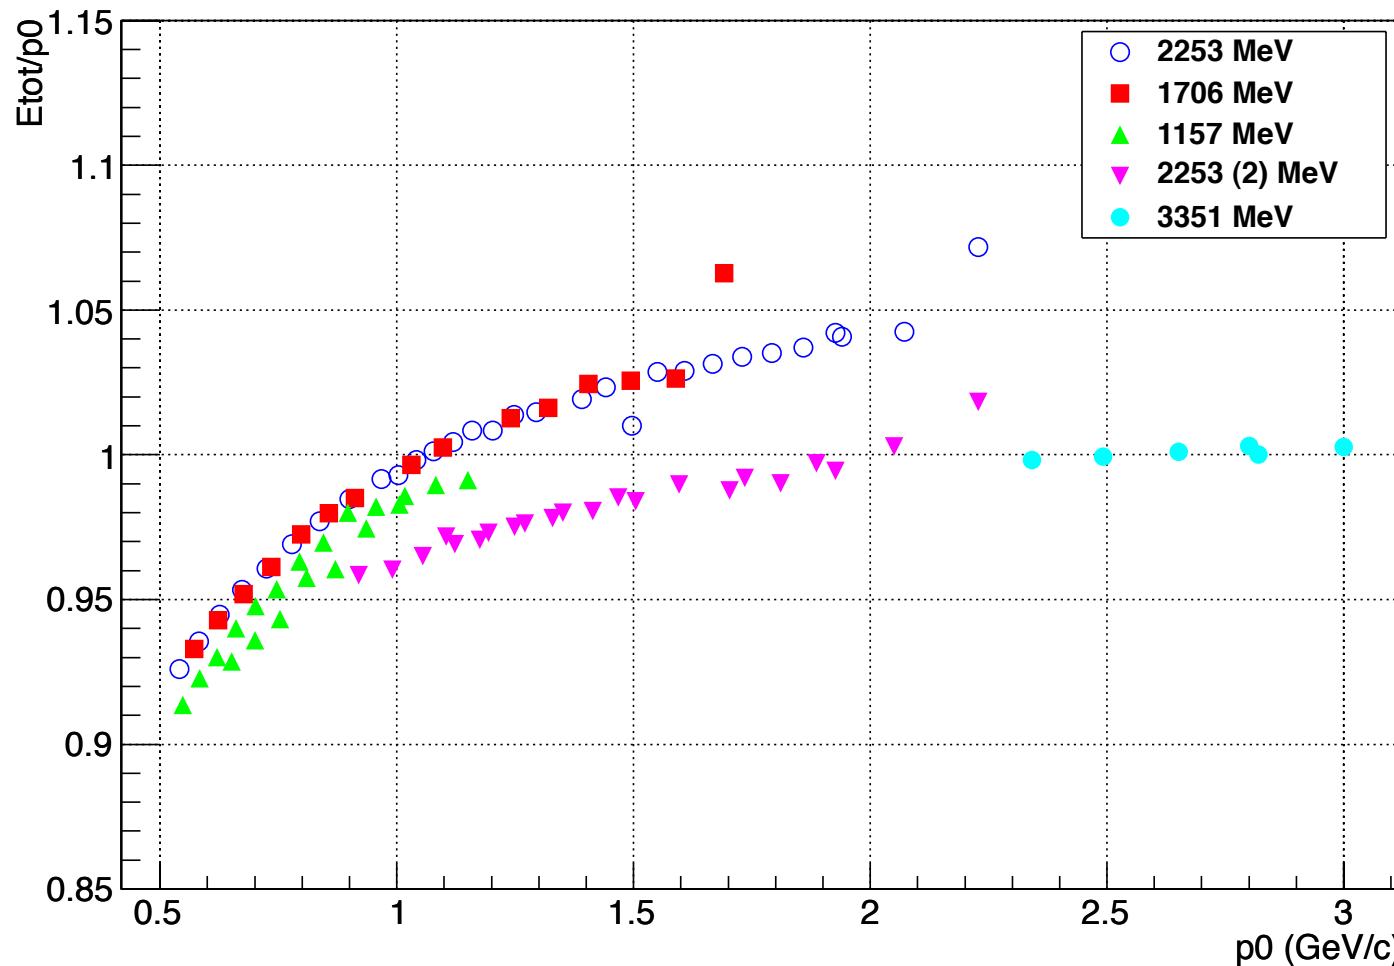

Method 2: 80/20 Split

- Align peaks in layer 1 (2) so that 80% (20%) of energy is deposited in that layer

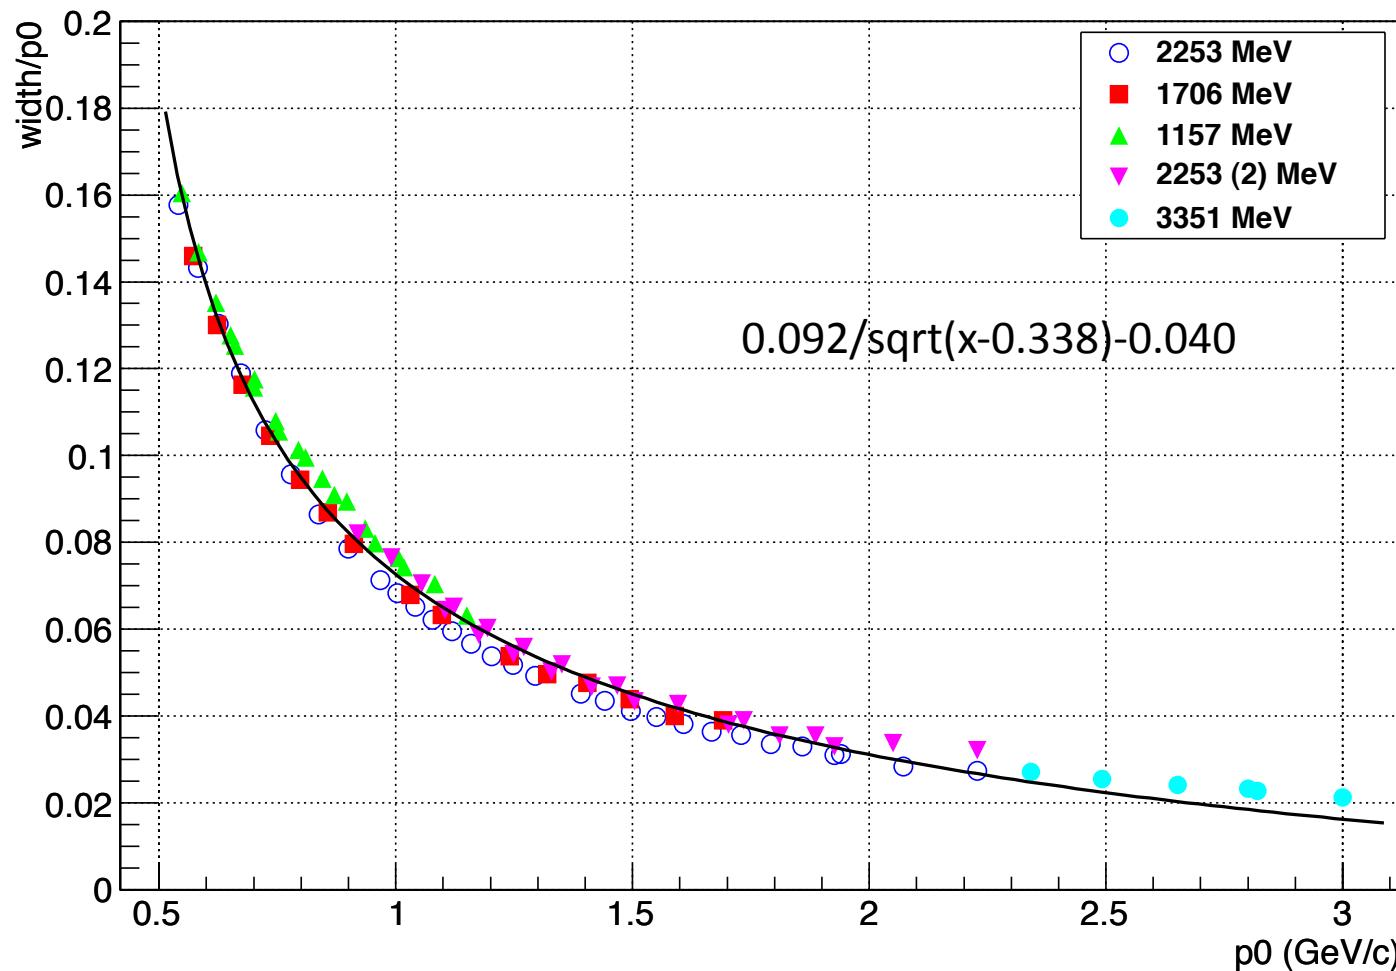

Method 2: 80/20 Split

LHRS Pion Rejector Calibration Stability Check

Method 2: 80/20 Split

LHRS Pion Rejector Resolution

Method 3

- Use two runs to determine the relative coefficients between the two layers

$$aA_1 + bA_2 + E_{loss} = E_{tot}$$

A_1 = Amplitude of First Layer (L.prl1.e)

A_2 = Amplitude of Second Layer (L.prl2.e)

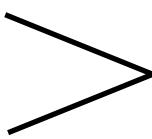

E_{loss} = Energy lost

E_{tot} = Total Particle Energy (p0)

a, b = Calibration Coefficients

Method 3

$$aA_1^{(1)} + bA_2^{(1)} + E_{loss}^{(1)} = E_{tot}^{(1)}$$

$$aA_1^{(2)} + bA_2^{(2)} + E_{loss}^{(2)} = E_{tot}^{(2)}$$

$$b = \frac{1}{(A^{(1)} - A^{(2)})} \left(\frac{E_{tot}^{(1)}}{A_1^{(1)}} - \frac{E_{tot}^{(2)}}{A_1^{(2)}} \right)$$

$$a = \frac{E_{tot}^{(1)}}{A_1^{(1)}} - bA^{(1)}$$

Assume full energy deposition
for runs ~ 1 GeV or less

where: $A^{(1)} = \frac{A_2^{(1)}}{A_1^{(1)}}$, $A^{(2)} = \frac{A_2^{(2)}}{A_1^{(2)}}$

p0 (MeV) : E_{tot}	L.prl1.e : A_1	L.prl2.e : A_2
724	281.18	33.22
1078	415.03	72.29

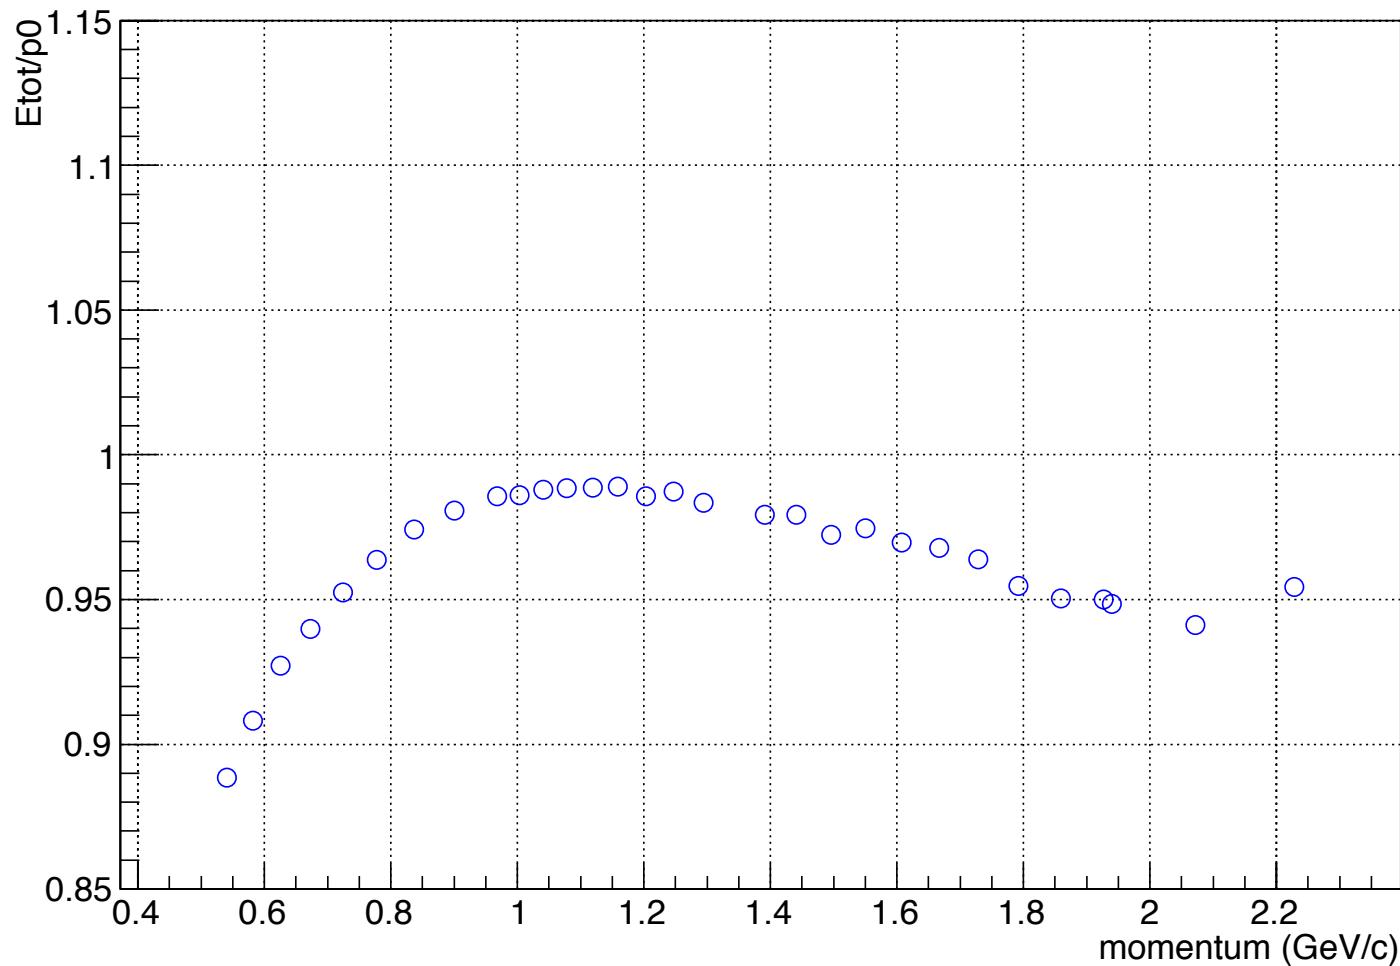

$$a = 2.527$$

$$b = 0.402$$

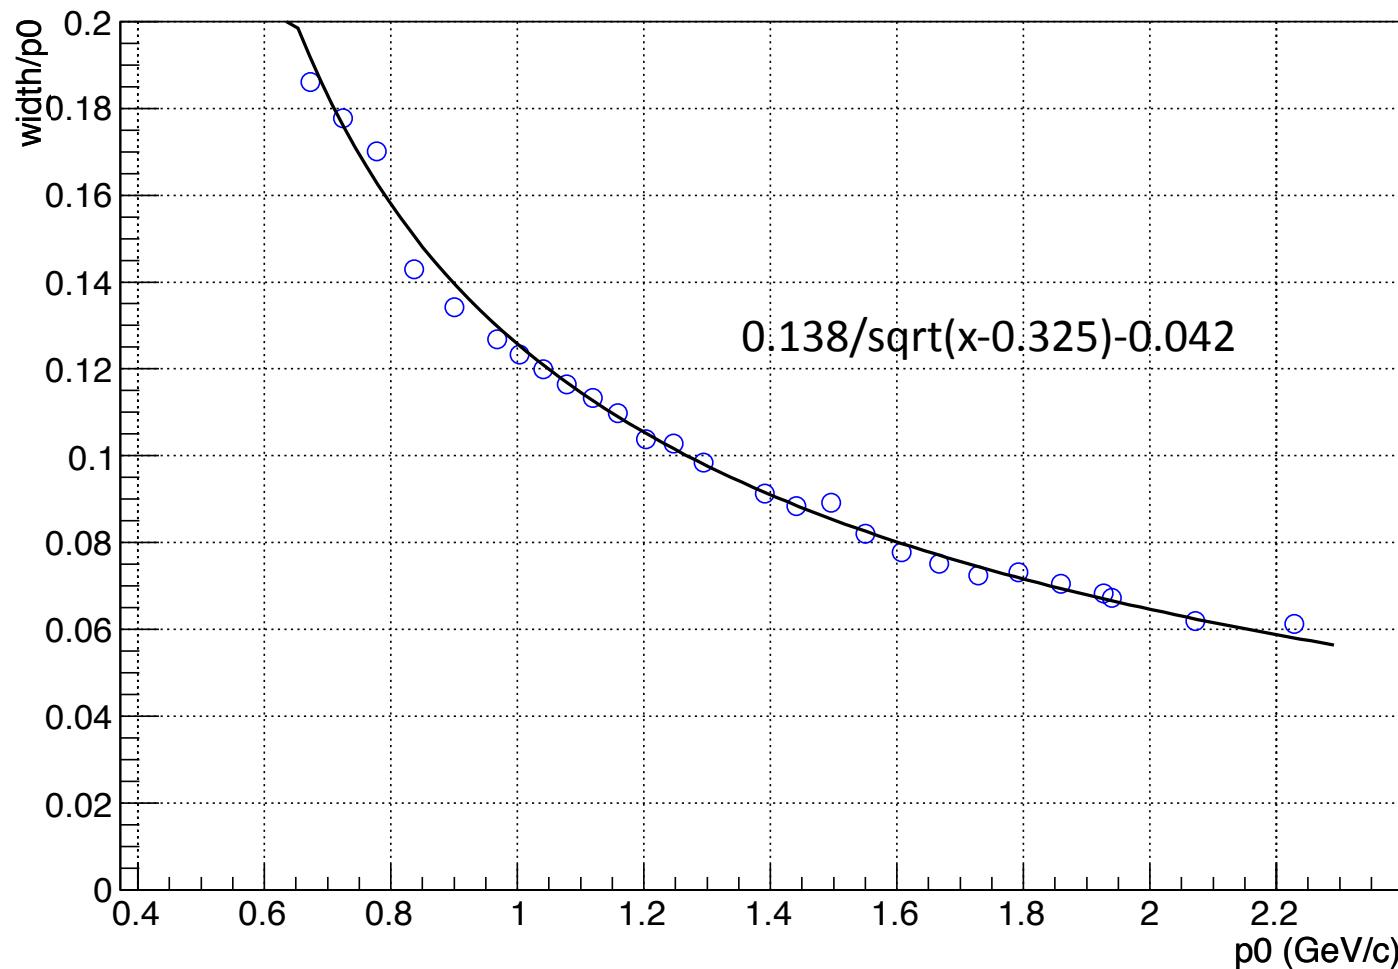

Method 3:

LHRS Pion Rejector Stability Check for 2.2 GeV
