RICH schematic view

- Radiator: Liquid Freon (15 mm) at Room temperature
- Radiator Vessel: 1.9 × 0.31× Neoceram (4 mm) / Quartz (5 mm)
- Proximity Gap: 10 cm
- Photon Detector: MWPC + 3 PAD PLANES (\sim 11000 pads)
- Dry Methane at STP

+ the evaporation facility (now at Stony Brook University)

Current RICH performance at 2.0 \pm 5% GeV/c $\Rightarrow \pi/K$ rejection 1:1000

- Mean Number of Firing Pads (for π) : $N_{PAD,\pi} = 13$
- Cherenkov Angle resolution (sigma) : $\sigma_{\theta_{\pi}} = 5$ mrad $\rightarrow \Delta \theta_{\pi,K} = 6\sigma_{\theta_{\pi}}$

$2.4 \,\, \text{GeV/c Upgrade}$

Requirement (?)

Rule of thumb: π/K rejection factor at the level of 1:1000

$$(\Rightarrow \Delta heta_{\pi,K} \geq 5.5 \cdot \sigma_{ heta})$$

Criteria

- Re-use existing (spare) parts as much as possible
- Minimize costs and resources
- Guarantee the existing performance (switching back to the pre-upgrade conditions in few hours)

Constraints

- Maximum available electronics channels: 2×11520
- Maximum pad plane size: $65 \times 45 \text{ cm}^2$ (evaporation chamber)
- $\,$ $\,$ Maximum size along particle trajectory ~ 1 m $\,$
- ???

Optimize the gap length and ...

- 1 NO CHANGES: leave as it is
- ② NEW FREON: use radiator with lower refractive index (C_5F_{12} instead of C_6F_{14})
- 3 2×PLANE: double the photon detection surface (double the pad planes)
- PAD/2: halve the pad size (double the pad numbers) on the same pad plane
- **INIXED**: quite a few combinations of the above; e.g.:
 - ► NEW RADIATOR and 2×PLANE
 - Reduce the pad size and increase the detection surface appropriately (up to the maximum available channels)

Options 3 and 4 are exclusive (max. electronics channel)

Optimize the gap length and ...

- INO CHANGES: leave as it is
- 2 NEW FREON: use radiator with lower refractive index (C₅F₁₂ instead of C₆F₁₄)
- 3 2×PLANE: double the photon detection surface (double the pad planes)
- PAD/2: halve the pad size (double the pad numbers) on the same pad plane
- **INIXED**: quite a few combinations of the above; e.g.:
 - ► NEW RADIATOR and 2×PLANE

Option 1 : NO CHANGES (Detector at 2.6 m from VDC)

Option 1 : NO CHANGES (Detector at 1.8 m from VDC)

Rome Group (ISS)

RICH @ JLab

11 April 2006 8 / 20

Option 2 : NEW FREON (Detector at 1.8 m from VDC)

Option 2 : NEW FREON: Technical/Thermal Issues

!! C5F12 boiling point @ 1atm [C] = 30 °C **!!**

Thermal Effects / Good News

- Very low neoceram (and quartz) expansion coefficient
- Epoxy elasticity will absorb dilatation effects (expected small)
- Mechanical stresses under control at $T=21^{o}$ C $\pm 20^{o}$ C

Option 2 : NEW FREON: Technical/Thermal Issues

!! C5F12 boiling point @ 1atm [C] = 30 °C **!!**

Thermal Effects / Good News

- Very low neoceram (and quartz) expansion coefficient
- Epoxy elasticity will absorb dilatation effects (expected small)
- Mechanical stresses under control at $T=21^{o}$ C $\pm 20^{o}$ C

Thermal Effects / Bad News

- Cavitation (?): hot spots in the liquid can cause localized high pressure ... but inclination (that is pressure variation) may compensate the decrease of vapor pressure with temperature
- Disandantageous Thermal Conductivity: any cooling system MUST NOT touch the radiator vessel in order to avoid propagation of possible vibrations to the fragile vessel
- Turbolence and Instability: higher freon flux may generate turbolence and mechanical instability of the radiator vessel

NEW FREON: Cooling System

Lateral cooling rods along the vessel long-side is not effective.

 \rightarrow Large cooling plate between the RICH entrance window and the neoceram vessel

NEW FREON: Cooling Stainless Steel Plate System

- $\bullet\,$ Two foils of stainless steel 0.5 $\div\,1.0$ mm thick
- Liquid cooler: $5 \div 10$ mm thick
- $m \circ~One~plane,~size:~\sim 300 imes 1500~mm^2$
- Weight: < 10 Kg

Additional material on particle path: $\sim 2~g/cm^2$ (now $1.3~g/cm^2$) Mechanically compatible with the existing structure (planarity to be verified)

French Company DATE (DEVELOPPMENT ET APPLICATION DES TECHNIQUES DE L'ENERGIE)

JQ P

NEW FREON: Is a cooling system really needed ?

Open Problems:

- Hot Spot
- Max Freon Speed

Rome Group (ISS)

• Max freon speed w/o cooling (\sim 30 min radiator vessel refill time / current system works at \sim 6 h) seems to be compatible with laminar flow in pipe ($R_c \sim 2200$) and vessel ($R_c > 10000$)

- Inlet freon temperature can be reduced to 10 °C
- Coarse cooling (down to 30 ⁰C) of the external radiator will help)
- Finite element analysis for mechanical stability

11 April 2006 13 / 20

200

RICH @ JLab

Option 3 : 2×PLANE (Detector at 1.8 m from VDC)

$2 \times PLANE$

- NO relevant technical issues
- Design is straightforward
- Re-use existing pad planes
- Use two acquisition systems (old and new one, both available)
- Some more contamination from delta electrons due to the middle break (\sim 3.5 cm). (however electron MIP kaon trajectory greater than \sim 6 cm!!)
- $ho~\sim 15~{
 m cm}$ longer detector
- Major Impacts:
 - New MWPC (largest cost)
 - ► Partially new mechanical supports for the front-end cards
 - Modify (increase) the glove box used in the evaporation of the CsI on the pad planes
 - Longer evaporation procedure
- Costs: quotation requested

Option 4 : PAD/2 (Detector at 1.8 m from VDC)

 $\Delta \theta_{\pi,K}^{MC} \sim 5.0 \cdot \sigma_{\theta} \Rightarrow \pi : K \le 1 : 1000$ (95% efficiency)

High front-end electronics compacteness is demanding ~

Pro's and Con's

Option	$\Delta \theta$	Pro	Con
1	4.4	Trivial Implementation	Poor performance
		Negligible cost and effort	
2	5.5	Good performance	Open issues
			Involve the fragile vessel
			Slightly complex design
			Add material in path (?)
3	6.0	Very Good performance	More space required
		Straight Design	Two readout systems
			Expensive (?)
4	5.0	Moderate performance	Electronics compactness
			Two readout systems
5	8.0	Superior performance	See 2 and 3

... than ?

- NO CHANGES and detector at 1.8 m: π/K rejection \sim 1 : 500 (not so bad)
- NEW FREON requires more analysis for cooling
- 2×PLANE better solution, but cost may be high (expecting quotation today!)
- PAD/2, complexity/benefit not convenient
- NEW FREON & 2×PLANE: superior performance, but ...

coming ...

- In the next couple of weeks expected results from the finite element analysis by the Engineer that designed the radiator vessel
- Careful evaluation of the $2 \times \text{PLANE}$ to reduce costs

JQ P
