

# SBS Monte Carlo Update

Seamus Riordan  
University of Massachusetts, Amherst  
[sriordan@physics.umass.edu](mailto:sriordan@physics.umass.edu)

November 6, 2013

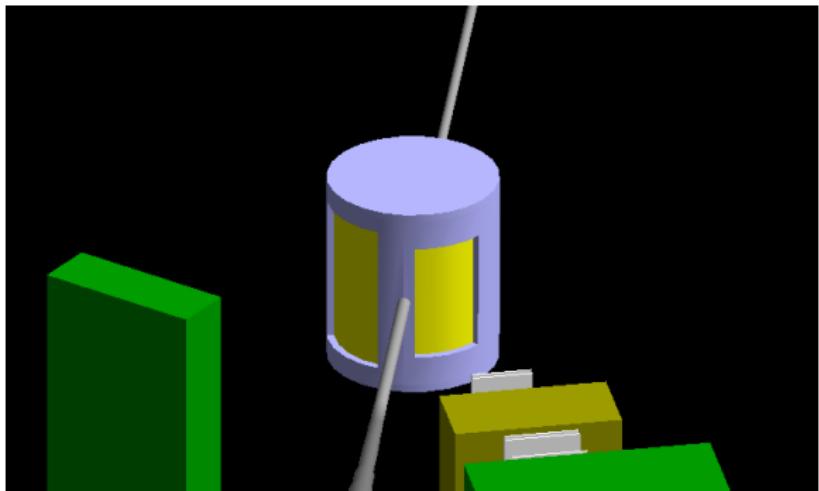

All code available at

<http://solid.physics.umass.edu/g4sbs.html>

- Read access is openly available
- Read/write access - sent your public key to me (instructions on above page)
- Requested a-sbs group, SBS disk space, farm project

EVERYTHING HERE IS PRELIMINARY AND A WORK IN  
PROGRESS

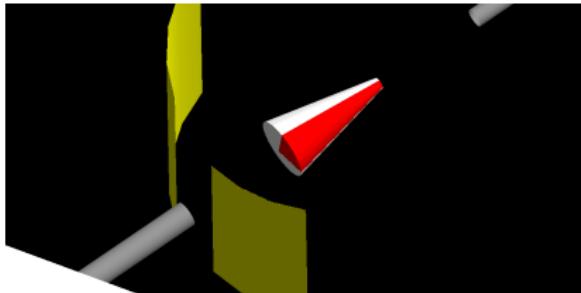

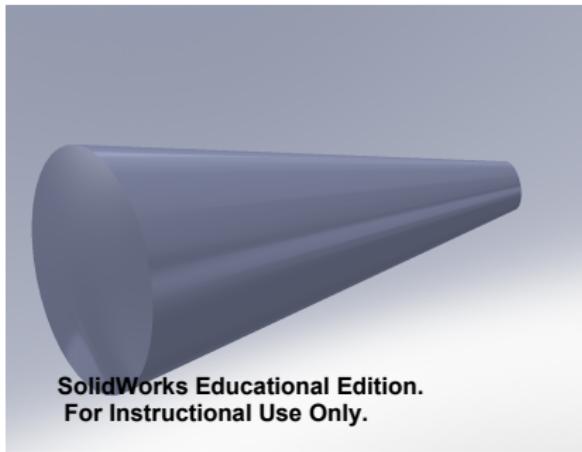

# Target Chamber

Scattering chamber specs:

- Windows designed to match acceptance of cryo-target experiments
- Inner diameter of 1.041 m, outer 1.143 m
- Window thickness 380  $\mu\text{m}$

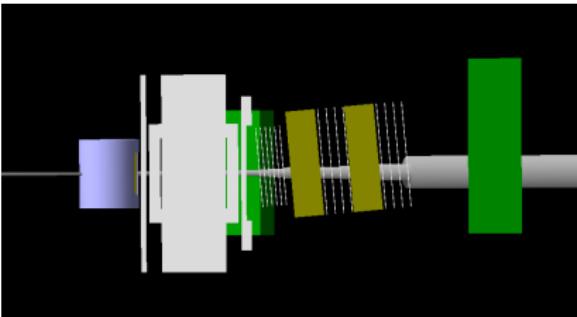

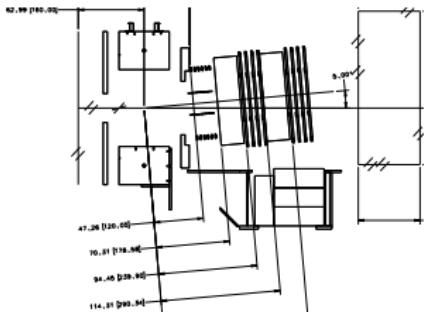

# Target Cell

Target cell specs:

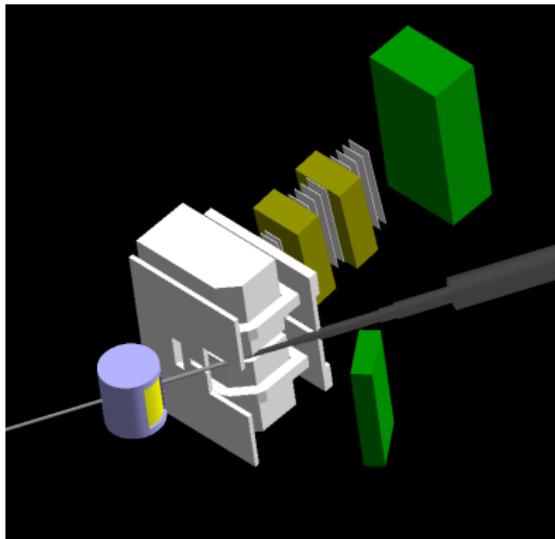

- Dimensions given by Silviu
- Upstream wall  $100 \mu\text{m}$
- Downstream wall  $125 \mu\text{m}$
- Outer wall thickness  $635 \mu\text{m}$

# Updated $G_E^p$ Configuration

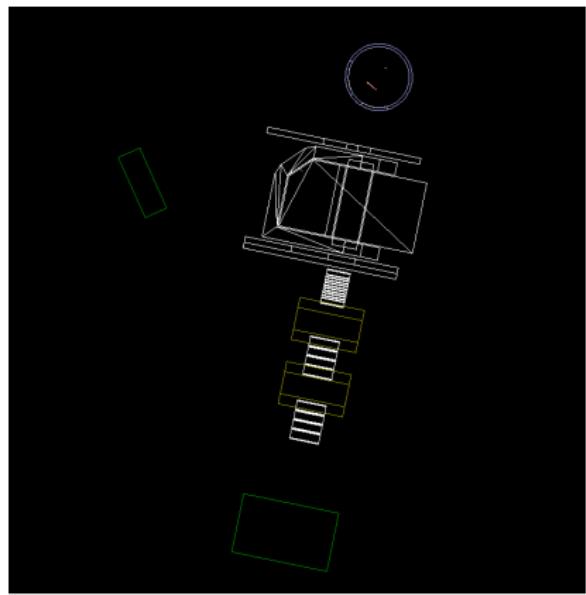

- Got new layout from AI
- Detector stack now at  $5^\circ$  pitch

# Field Clamps and 48D48

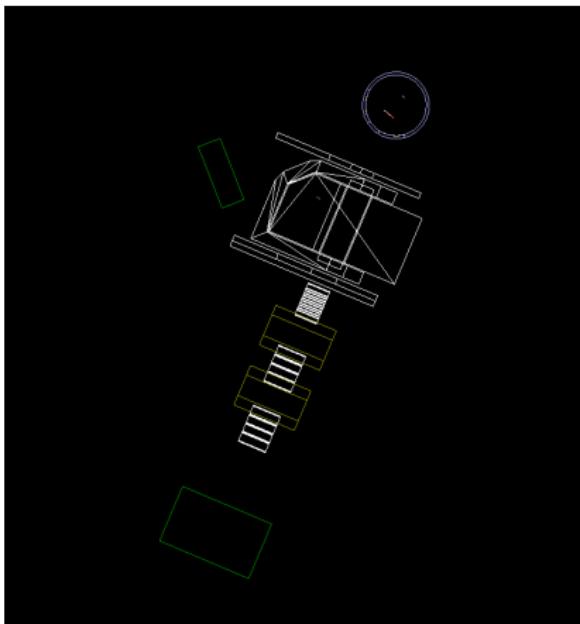

- Field clamps taken from model in TOSCA
- Windows for beampipe modified slightly to fit configurations
- Cuts in magnet taken from TOSCA, add in cut for Ecal acceptance

# Field Clamps Interference

$$Q^2 = 5 \text{ GeV}^2$$

$$Q^2 = 12 \text{ GeV}^2$$

- Clamps may interfere with  $e^-$  path in  $G_E^p$

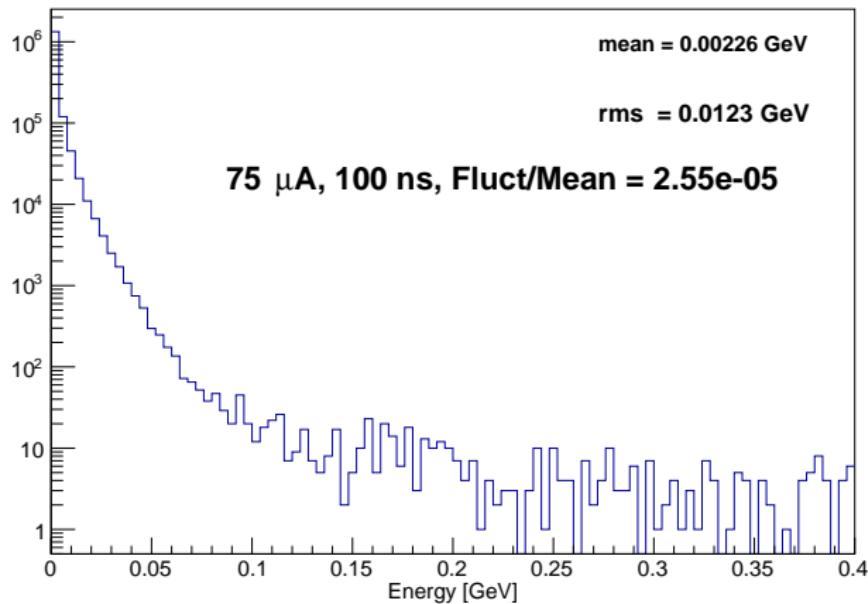

# $G_E^p$ Calorimeter Backgrounds

- Ran single electrons through full setup
- Recorded hits in calorimeters, but ignore showering
- From single events, integration over ADC gate given by:

$$\begin{aligned}\bar{E} &= N_e \mu \\ \Delta E &= \sqrt{N_e} \sqrt{\mu^2 + \sigma^2}\end{aligned}$$

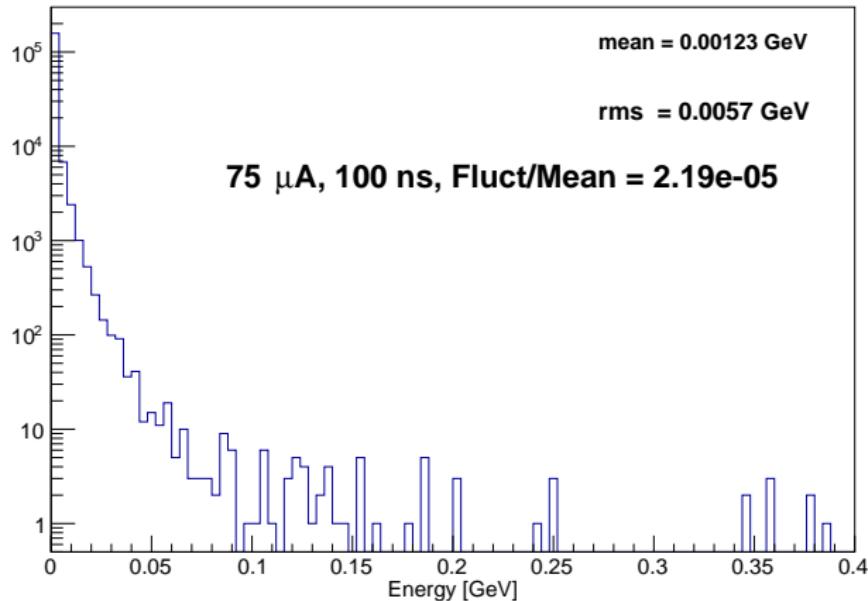

# $G_E^p$ Calorimeter Backgrounds, $Q^2 = 5 \text{ GeV}^2$

## $G_E^p$ 5 $\text{GeV}^2$ Energy Distribution - ECal

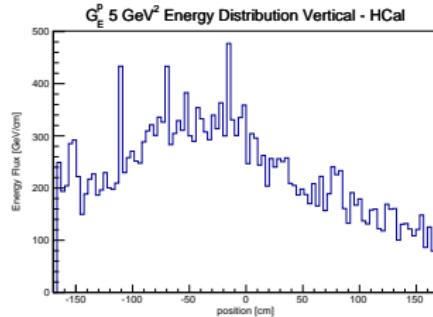

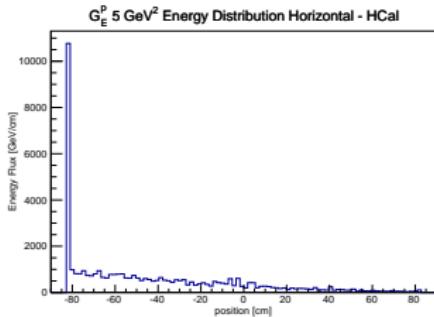

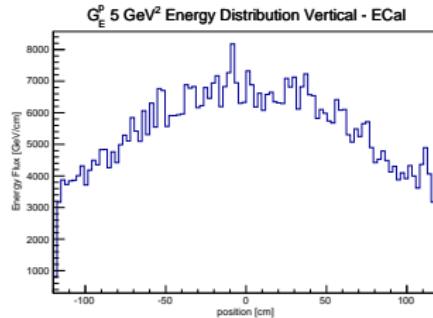

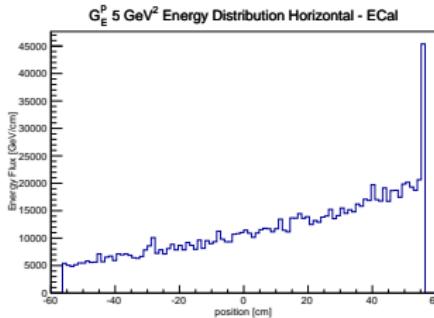

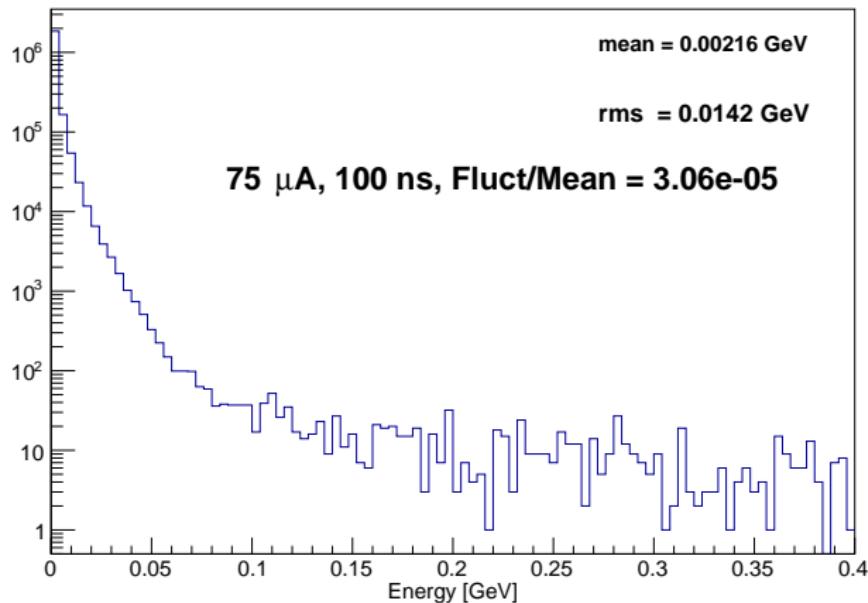

# $G_E^p$ Calorimeter Backgrounds, $Q^2 = 5 \text{ GeV}^2$

## $G_E^p$ 5 $\text{GeV}^2$ Energy Distribution - HCal

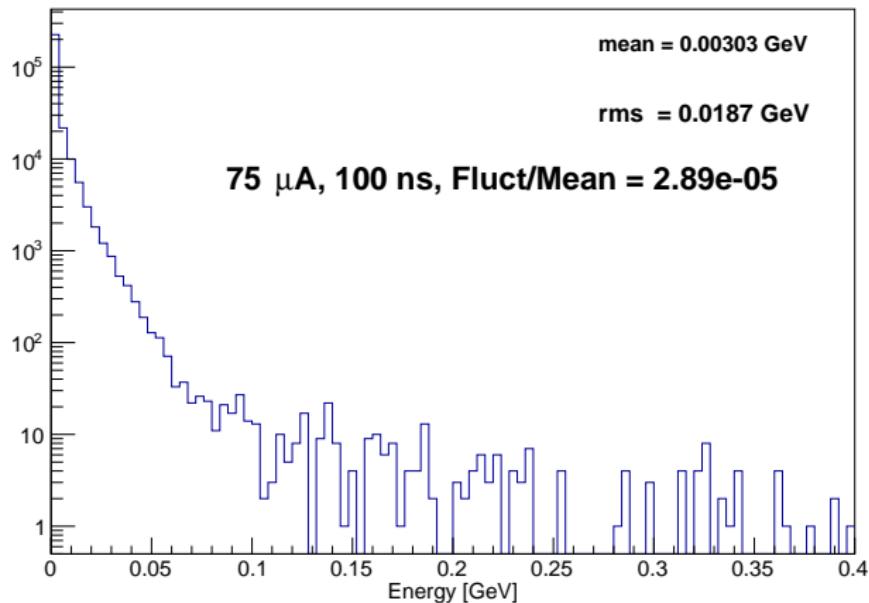

# $G_E^P$ Calorimeter Backgrounds, $Q^2 = 5 \text{ GeV}^2$

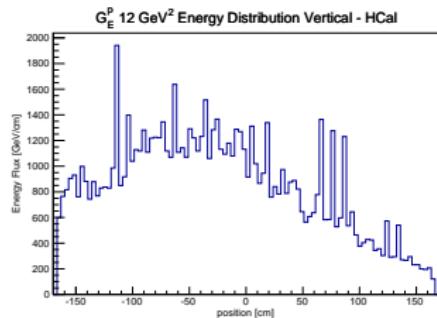

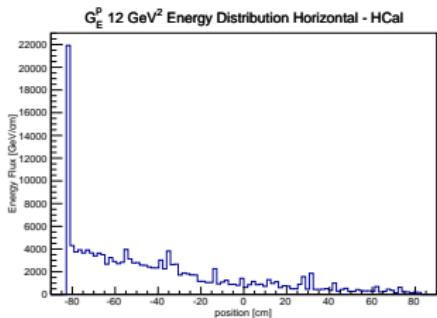

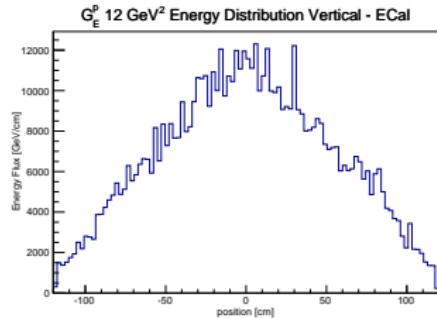

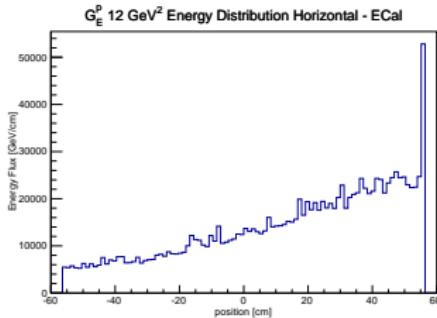

$G_E^p$  12 GeV $^2$  Energy Distribution - ECal

# $G_E^p$ Calorimeter Backgrounds, $Q^2 = 12 \text{ GeV}^2$

$G_E^p$  12 GeV $^2$  Energy Distribution - HCal

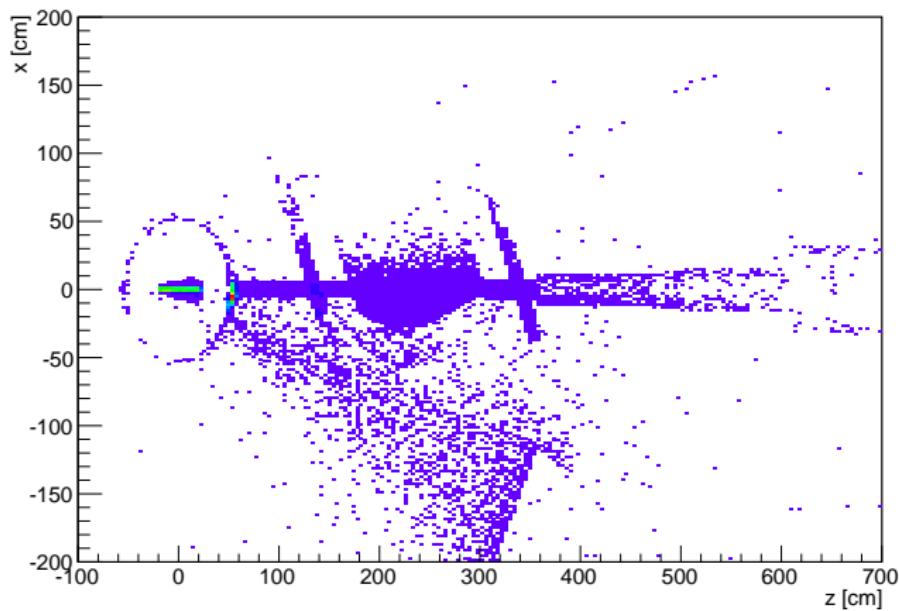

# $G_E^P$ Calorimeter Backgrounds, $Q^2 = 12 \text{ GeV}^2$

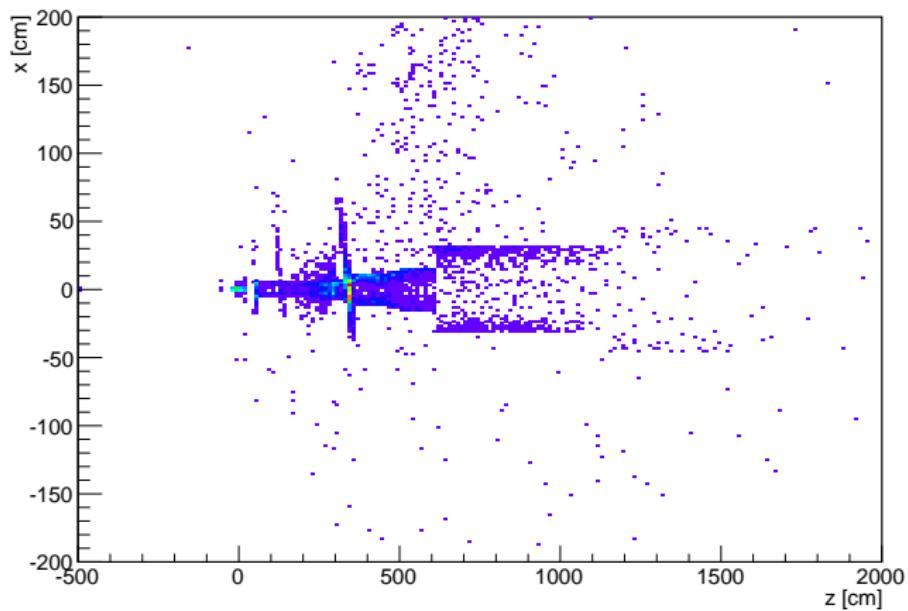

# $G_E^p$ Calorimeter Backgrounds, $Q^2 = 12 \text{ GeV}^2$

ECal Background Origin,  $G_E^p$ ,  $Q^2 = 8 \text{ GeV}^2$

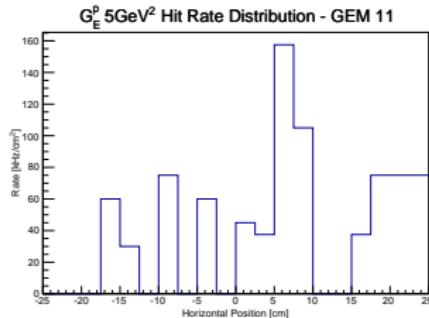

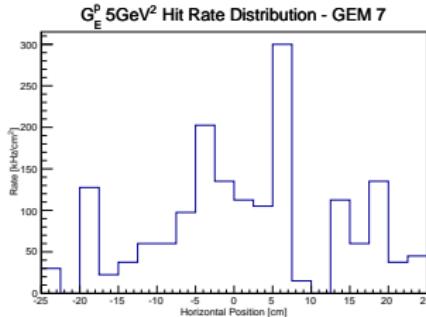

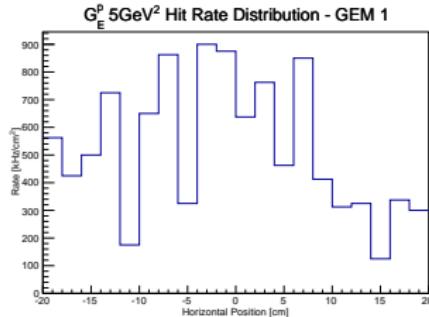

# $G_E^p$ Calorimeter Backgrounds, $Q^2 = 12 \text{ GeV}^2$

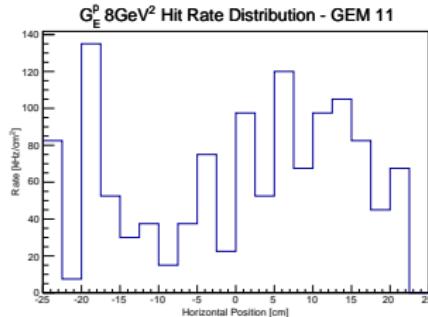

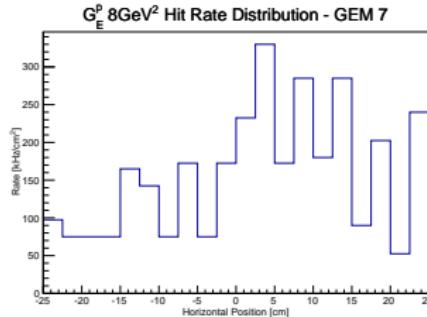

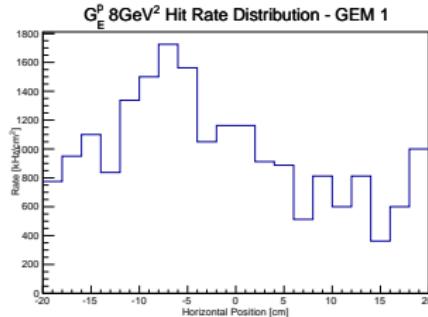

HCal Background Origin,  $G_E^p$ ,  $Q^2 = 8 \text{ GeV}^2$

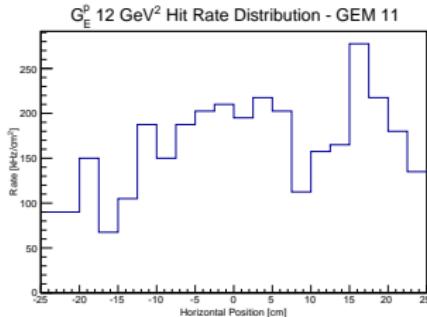

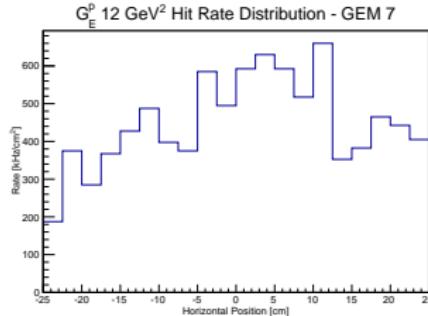

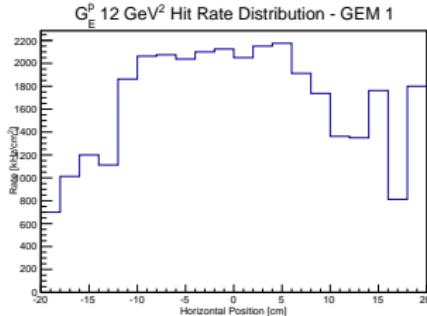

First GEM in each stack:

First GEM in each stack:

First GEM in each stack:

- Continue to iterate geometries, analysis
  - Shielding
  - Clamps/48D48
  - Beamline/target chamber
  - GEM construction
- Look at acceptances with new configuration
- Ensure no overlapping geometries
- Maintain/improve codebase
  - Import remoll-style IO, generators
  - Pre-vertex radiative effects and multiple scattering missing
  - Adapt so has output trees compatible with SBS GEM response code?
