

## Updates of the GMp meeting held on 24 October, 2014:

- 1, Longwu and Barak will make a report about the development of EDTM, and they will talk about their approach to re-timing to an expert, Bob.
- 2, Barak developed a script to align the S2m ADC peak positions, and it will be part of the job for shift operators.
- 3, Longwu will continue the job of aligning the colarimeter ADC peak positions.
- 4, Yang showed fitting plots of optics optimization including more background in the cuts . Bogdan suggested to make square cuts instead of circle cuts so that the background will be linear.
- 5, The plan about analyzing the reconstruction efficiency of FPP using VDC tracks, or analyzing the reconstruction efficiency of one VDC chamber using the other VDC chamber and FPP was talked about. A event displaying script was suggested to be developed.
- 6, Barak showed modified scaler GUI and Longwu showed modified onlineGUI which can print all the plots into one file.
- 7, Thir displayed plots for unser calibration. Since DVCS asks the current to be lower than 20uA, fitting only with data where the curren is below 20uA will be more useful.
