A STUDY OF THE SPIN STRUCTURE OF THE NEUTRON IN DEEP INELASTIC
SCATTERING OF POLARIZED ELECTRONS ON POLARIZED NEUTRONS

BY

Michael S Spengos

ABSTRACT

The internal spin structure of the neutron, was studied in deep inelastic scattering of longitudinally polarized electrons from a polarized ^3He target in the End Station A of the Stanford Linear Accelerator Center (SLAC). The spin asymmetry of the neutron was measured at energies between 19 and 26 GeV in the range $0.03 \leq x \leq 0.06$ at an average Q^2 of $2 (\text{GeV}/c)^2$. The results are in agreement with a new measurement of the asymmetry by SMC within their six times larger uncertainties. The spin dependent structure function $g_1(x)$ for the neutron was determined from the asymmetry measurement and, its integral over x is found to be $\int_0^1 g_1^n(x) dx = -0.038 \pm 0.009$. This result is 2.7 standard deviations from the Ellis-Jaffe Sum Rule and combined with the EMC results from the proton in very good agreement with the Bjorken Sum Rule. In the Quark Parton Model (QPM), in conjunction with the weak coupling constants F and D , from baryon decay, the result implies that the quarks contribute approximately 32% of the nucleon helicity. Finally, different ways of evolving the data, based on various theoretical models, is attempted and future aspects for spin physics, with emphasis at spin physics at SLAC, are discussed.

ACKNOWLEDGMENTS

Getting a Ph.D. in High Energy Physics, is considered by many people in the field as a big milestone, after which someone becomes a professional physicist and enters the "real world". My point of view is somewhat different. I would like to think of the professional life of a High Energy Physicist as a continuous learning process, which starts in graduate school and ends whenever someone loses interest. The first years of this process, the graduate school years, (not only in High Energy Physics but pretty much in every field) are the years where other people can have a decisive influence, positive or negative, and shape someone's career. There are many people who have influenced me in a positive way since I started graduate school and I am pleased that I have here an opportunity to thank them.

I would like to express my gratitude to the members of my thesis committee, my advisor Ray Arnold for recruiting me to SLAC, and giving me the chance to participate in several world class experiments including E142, Steve Rock for always finding the time to answer my questions and helping me with his unique experience and expertise, Peter Bosted for supervising the latest stages of my work and always pointing out the right answers, Zen Szalata for helping me every single time I asked for his help, for being the nice person he is and for giving me the opportunity to become the world class construction worker I am.

I would also like to thank Charley Young, Zeinadin Meziani, Makis Petratos, and Emlyn Hughes for all the useful discussions during the analysis and for being good friends. You guys should be proud of what you've done, are doing, and will be doing for

Spin Physics. I have been fortunate all around in the other thesis graduate students I had to work with on E142. From the early designing stages to the final analysis I had to work very closely with Dave Kawall, James Xu, and Jim Dunne whom I consider as the best coworkers someone can have. Hunter Middleton and Yves Roblin made our less frequent meetings a true pleasure.

Many thanks go to Steve Rock and Yves Terrien for being my mentors in designing and testing the E142 trigger, Jerry Davies for being so helpful and making things work when it seemed impossible, the summer of 92 visitors, and especially Jeff Fellbaum, for helping with the electronics, the summer of 93 visitors for the infamous volley ball games, the SLAC "colliders", the Friday "soccer gang" and especially David Fryberger who is an inspiration to us all, Lynn Hanlon for being thoughtful, nice and helpful, the whole French group for introducing me to French food and wine and reminding me of Europe, my officemates from the early years at SLAC Thia Keppel and Ling-Hong Tao, Jim Johnson for knowing so much about Physics and sailing, Rad Antonov for being who he is, and finally Joe Montana just for being the greatest quarterback ever played the game I came to like so much since I was introduced to it when I first came to the American University from Greece.

I have been benefited tremendously by knowing the Dunne, the Petratos and the Lazanas families. Here is to you Jim for being a good friend, a good listener, for helping me so much with everything and for making me feel that no matter what happened I could count on your support. Demetra or Demie or Mimi or "The Demster" Dunne is not only one of the most caring and loving persons on earth but also a true master of the English Language. Makis and Mina, I really do not think I could have done it if I did not know

you, ένα μεγάλο ευχαριστώ για όλα παιδιά. The friendship of Anthony and Vaso will be along with my degree my biggest accomplishments during my stay in the Bay area.

This chapter would be incomplete if I didn't express my thanks to all my professors back at the American University, and especially Romeo Segnan, where I spend my best two years in Graduate school. I would also like to thank Bruce Flanders for helping me deal with the bureaucratic part of the late stages.

To thank my family in a foreign to them language would be meaningless, therefore the reader of the next paragraph can either learn Greek or view the whole paragraph as a very complicated equation which can also be used as a huge "fudge" factor to modify the final answer in chapter 4 according to their taste.

Το να ευχαριστει κανεις αγαπημενα του προσωπα ειναι και συνηθισμενο και σωστο. Το να ευχαριστει ομως κανεις τον ιδιο του τον εαυτο θα μπορούσε να χαρακτηριστεί σαν ανοητο. Για μενα τα αρχικα των ονοματων Ε.Α.Σ ειναι και θα ειναι παντοτε μερος του ιδιου μου του εαυτου. Κωστα αν και ποτε δεν σου το εχω πει, σε σενα χροσταω την αποφαση μου να ασχοληθω με την Φυσικη.
