# *E04-007: Precision Measurements of Electroproduction of $\pi^0$ near Threshold*

## Motivation:

Existing measurements, in particular those from Mainz, have shown strong disagreements with the predictions of Chiral Perturbation Theory (ChPT).

Measured cross-sections disagree with phenomenological models of SAID and MAID

$$Q^2 = 0.1 \left( \text{GeV}/c \right)^2$$
$$\Delta W = 1(\text{MeV}) - 2(\text{MeV})$$

# Previous $P(e, e'p) \pi^0$ Data

Required LECs derived from measurements at

$$Q^2 = 0.1(\text{GeV}/c)^2$$

$$Q^2 = 0.05(\text{GeV}/c)^2$$

- Dashed line: MAID
- Data points: Mainz
- Solid line: ChPT

# *E04-007 Experiment*

## Experiment Goal:

Making high precision cross-section measurement of  $H(e, e' p)\pi^0$  reaction near threshold in a fine grid of  $Q^2$  and  $W$ ,  
 $Q^2 = 0.045 - 0.45 \text{ (GeV/c)}^2$   
 $\Delta W = 0 - 30 \text{ MeV}$  above threshold.

Longitudinally polarized beam (67% polarized) allows extraction of the helicity dependent structure function,  $\sigma_{LT}$ .

Experiment ran March 2008 - May 2008

# *E04-007 Experiment*

Obtaining the total cross section involves determination of the structure functions,  $\sigma_T + \varepsilon_L \sigma_L$ ,  $\sigma_{TL}$ , and  $\sigma_{TT}$  for which the out of plane  $\phi$  dependence of the cross section will be used.

The desired “five-fold” cross section is related to the mentioned structure functions through (in CM)

$$\frac{d\sigma_\nu}{d\Omega_\pi^*} = \frac{d\sigma_T}{d\Omega_\pi^*} + \varepsilon_L \frac{d\sigma_L}{d\Omega_\pi^*} + \left[2\varepsilon_L(1+\varepsilon)\right]^{1/2} \frac{d\sigma_{TL}}{d\Omega_\pi^*} \cos\phi + \varepsilon \frac{d\sigma_{TT}}{d\Omega_\pi^*} \cos 2\phi + h \left[2\varepsilon_L(1-\varepsilon)\right]^{1/2} \frac{d\sigma_{LT'}}{d\Omega_\pi^*} \sin\phi$$

Which appears in cross section as

$$\frac{d\sigma}{d\Omega_e d\Omega_\pi^* dE} = \Gamma \frac{d\sigma_\nu}{d\Omega_\pi^*}$$

and asymmetry is given by

$$A_{LT'} = \frac{A_m}{P_e \langle \sin\phi_\pi^* \rangle}, \quad A_m = \frac{N_p^+ - N_p^-}{N_p^+ + N_p^-}.$$

# Experiment Configuration

**BigBite:** detects low momentum protons

**LHRS:** detects scattered electron

**RHRS:** used as luminosity monitor

**Target:**

6 cm long, 1" diameter LH2

**Electron beam:**

$E = 1.194 \text{ \& } 2.323 \text{ GeV}$

$I = 3\text{--}8 \text{ }\mu\text{A}$

**Luminosity :**  $10^{37} \text{ Hz/cm}^2$

# Target

LH2 cells:

- 6 cm long & 2.54 cm diameter
- Thin 0.005" Al windows
- Collimators shield the detectors from the cell windows

Special flange with 0.003" Ti window

# Experiment Configuration

**BigBite:** detects low momentum protons

**LHRS:** detects scattered electron

**RHRS:** used as luminosity monitor

**Target:**

6 cm long, 1" diameter LH2

**Electron beam:**

$E = 1.194 \text{ GeV}$

$I = 3\text{--}8 \mu\text{A}$

**Luminosity :**  $10^{37} \text{ Hz/cm}^2$

# *BigBite Spectrometer*

MWDC

Proton tracking

Scintillators

Proton trigger and PID

Magnet

He bag

Low-density path for the proton

# Wire Chambers & Scintillators

## MWDC:

Front chamber: 6 wire planes

*140 cm x 35 cm*

Back chamber: 6 wire planes

*200 cm x 50 cm*

2052 signal wires

## Scintillators:

$\Delta E$  plane: 3 mm

E plane: 30 mm

# *BigBite Spectrometer*

**Magnet:** 1 Tesla dipole  
**He bag:** Custom 0.0035" thick polyurethane, helium filled

BigBite spectrometer was shielded with a steel wall.  
MWDC and Scintillators all mounted at  $43.6^\circ$  from the beam line

# Experiment Configuration

**BigBite:** detects low momentum protons

**LHRS:** detects scattered electron

**RHRS:** used as luminosity monitor

**Target:**

6 cm long, 1" diameter LH2

**Electron beam:**

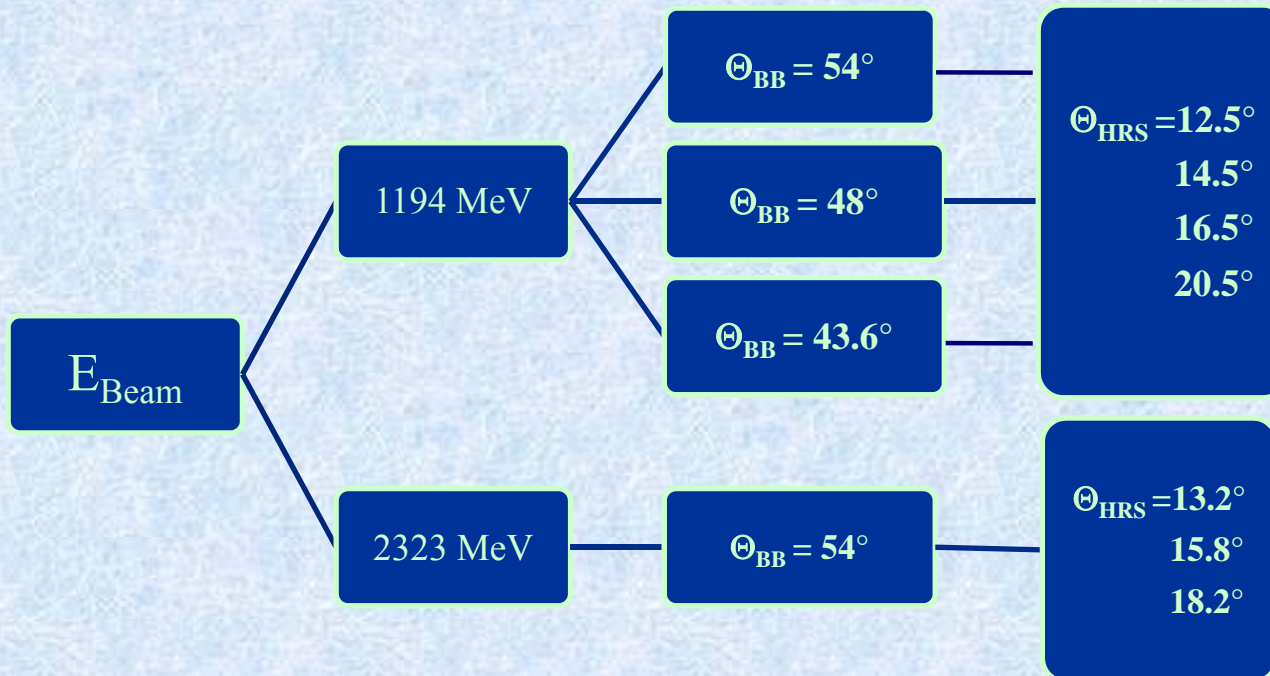

$E = 1.194 \text{ GeV}$

$I = 3\text{--}8 \mu\text{A}$

**Luminosity :**  $10^{37} \text{ Hz/cm}^2$

# *Kinematical Layout*

# *Data Analysis*

**Data:** 15 Kinematics

accumulated charge @1.194 GeV = 4.8 Coulombs

accumulated charge @2.323 GeV = 0.8 Coulombs

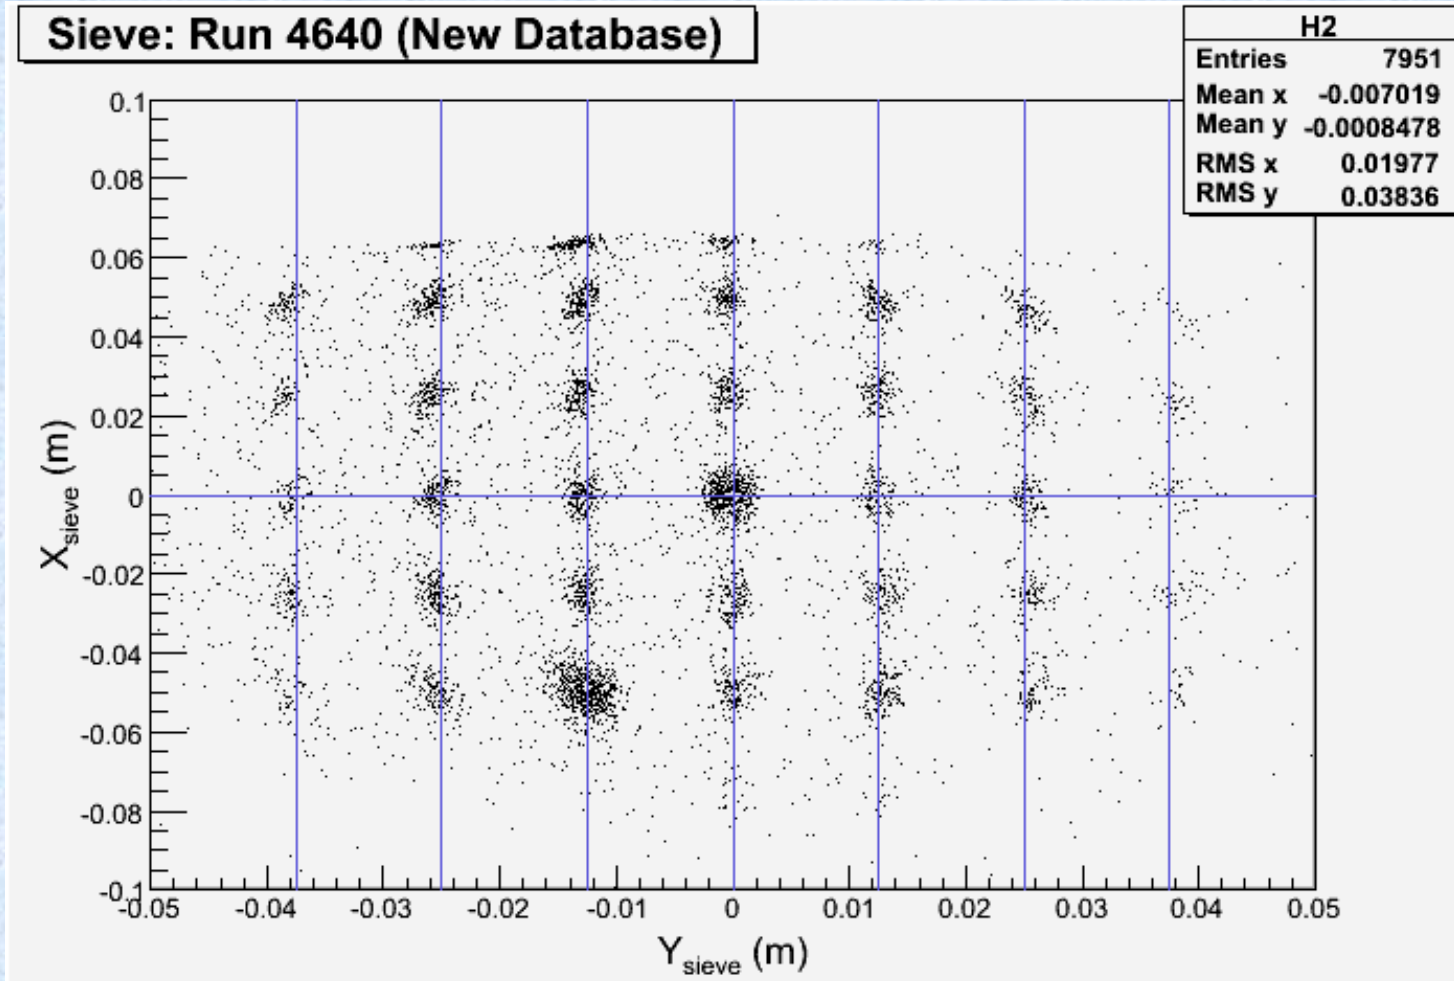

**HRS Optics :** Nearly complete

**PID:** Near completion

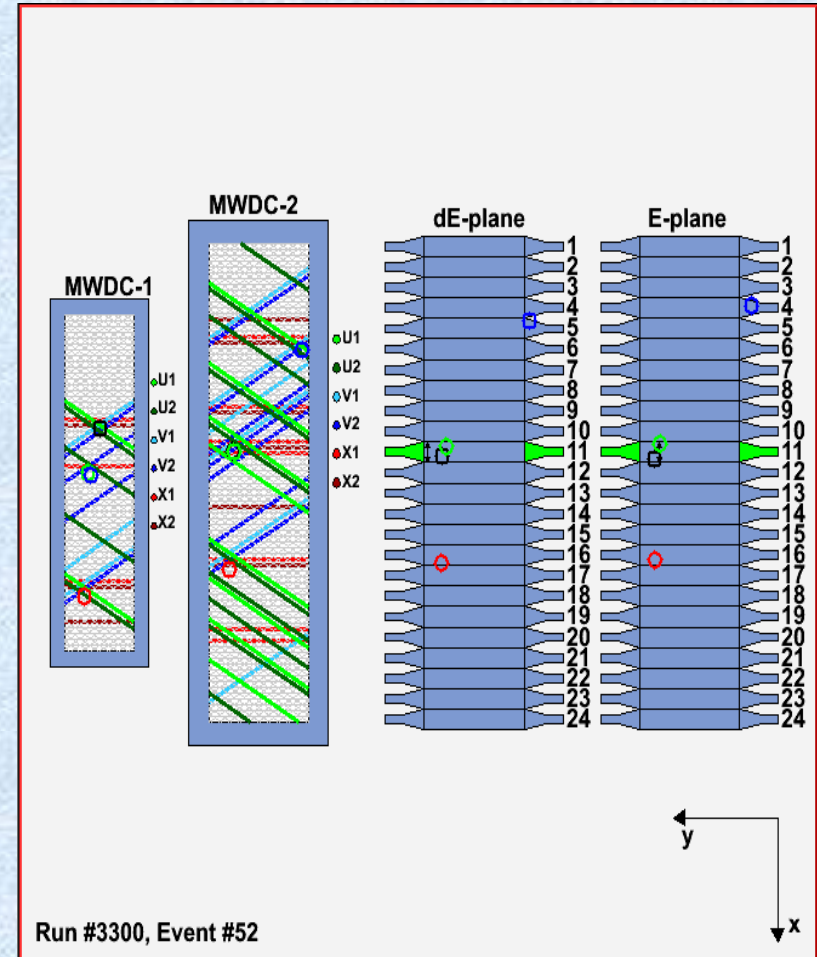

**BigBite Optics:** In progress

**Timing Corrections:** In progress

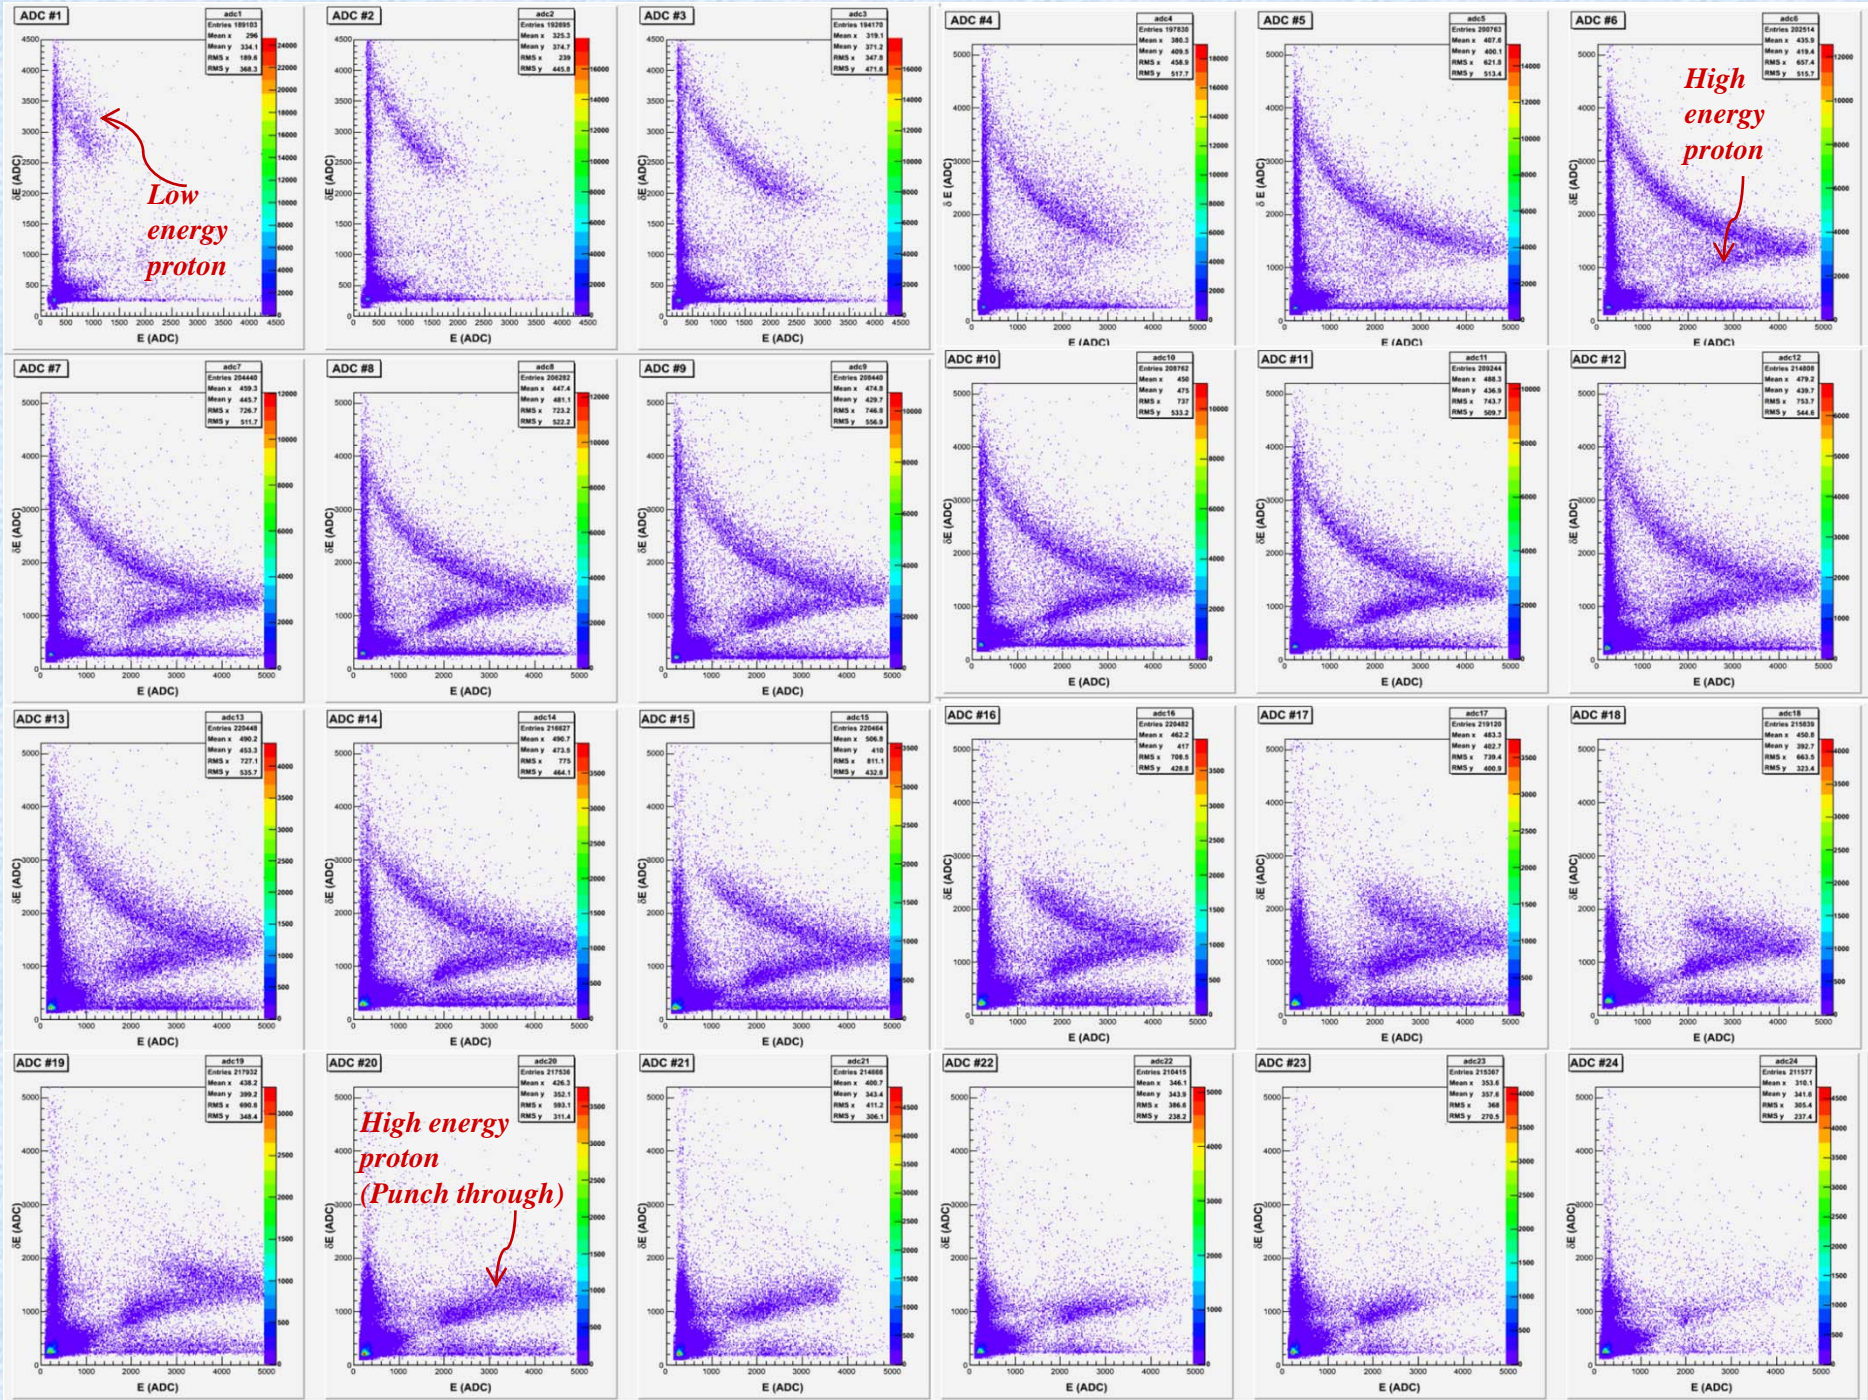

# Calibrations: HRS Optics

# PID & BigBite Optics

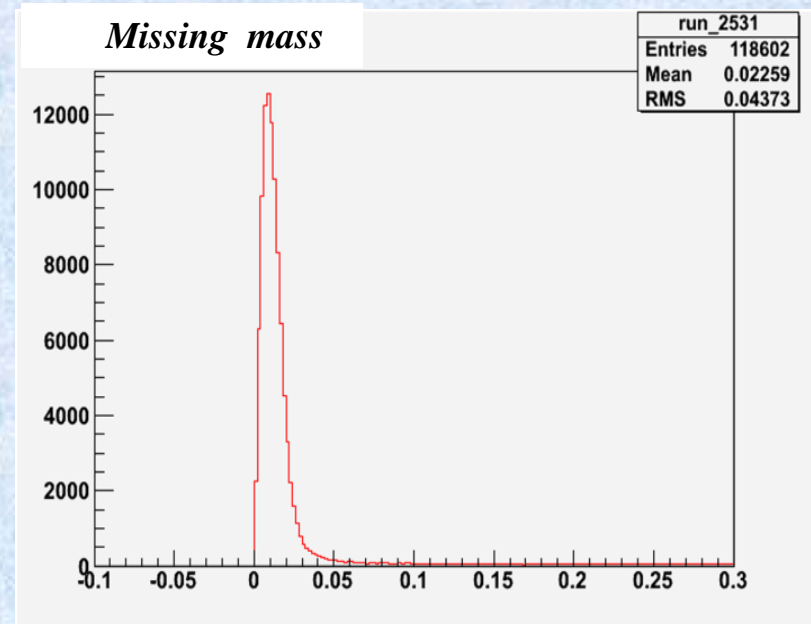

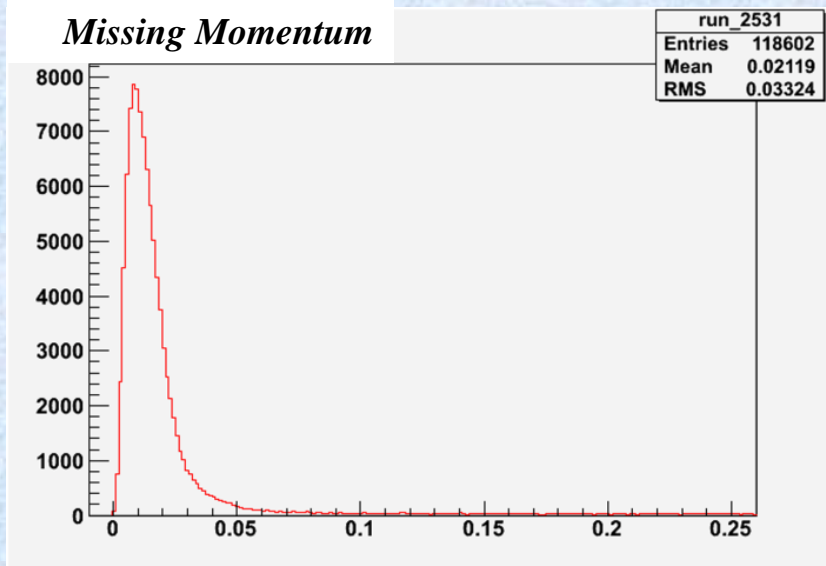

# Calibrations: *BigBite Optics*

Elastic  $H(e, e'p)$

# Calibrations: *BigBite Optics*

## Production Run

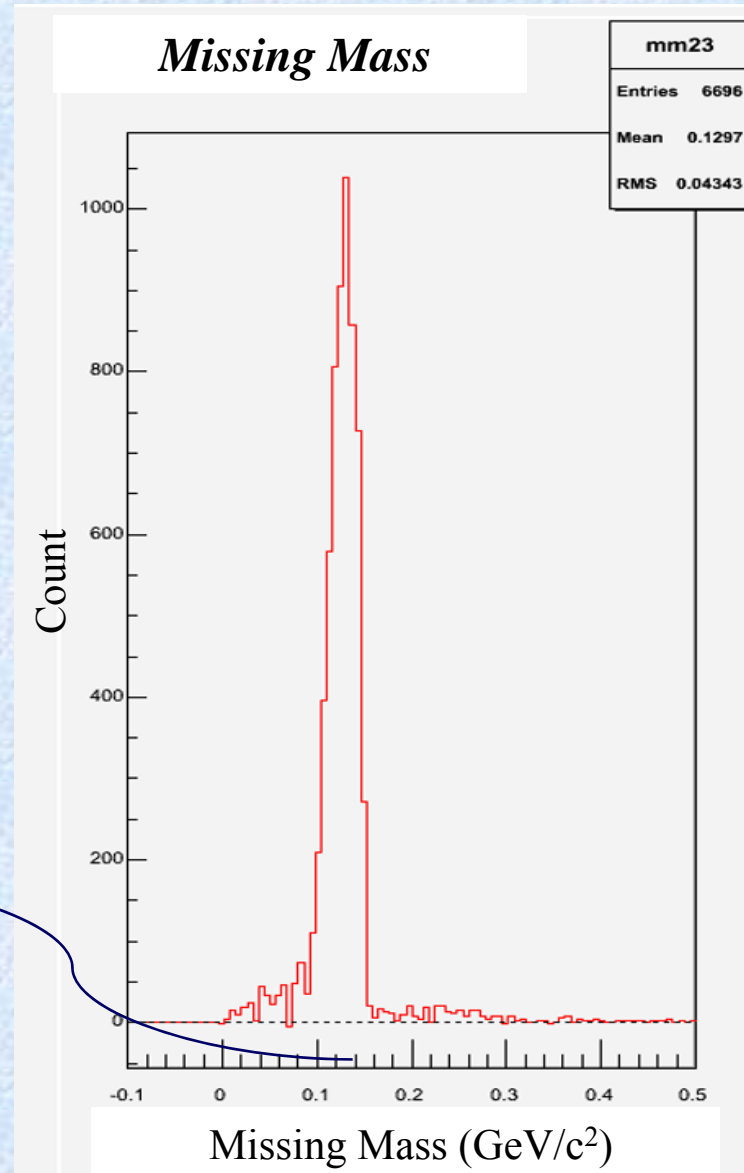

$$E_{\text{Beam}} = 1.194 \text{ GeV}$$

$$\Theta_{\text{BB}} = 48^\circ$$

$$\Theta_{\text{LHRS}} = 20.5^\circ$$

$$Q^2 = 0.15 \text{ (GeV/c)}^2$$

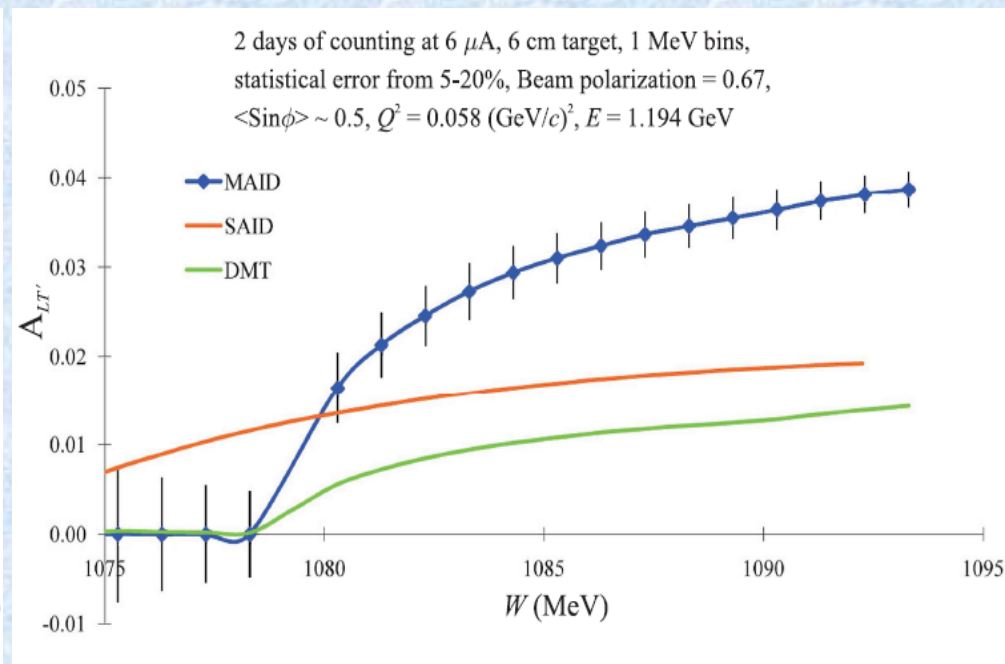

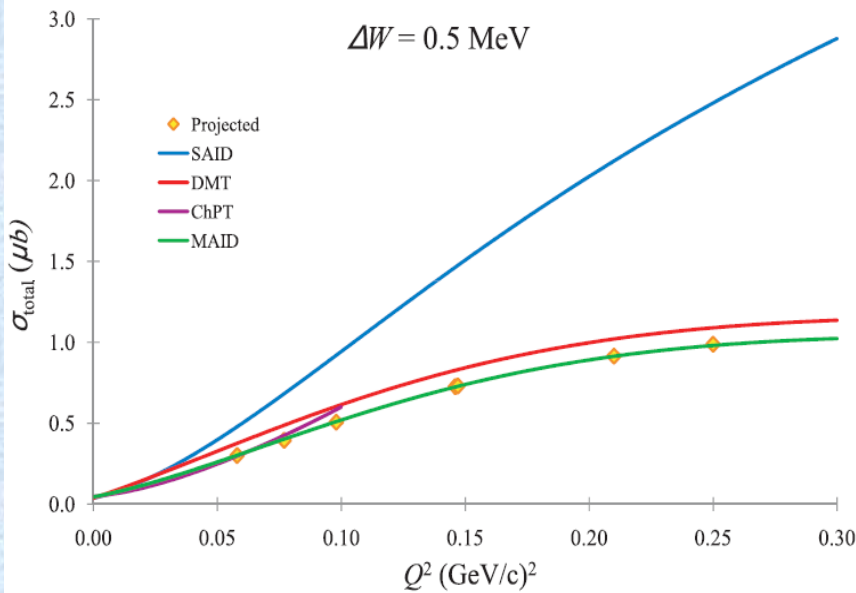

$$M_{\pi^0} = 0.135 \text{ GeV/c}^2$$

# Summary

- Precise data in fine bins of  $Q^2$  and  $\Delta W$  has been taken and is currently being analyzed.
- We expect relative  $\sigma_{\text{tot}}$  by December 2009
- Asymmetry and Preliminary results by the end of Summer 2009

Projected data:

*Thanks!*
