and the Hall A Collaboration

Motivation / Goals

• Establish the underlying dynamics of hard nuclear photodisintegration, leading to:

- Improved understanding of the NN interaction, and/or
- Improved understanding of the quark and/or short-range structure of nuclei
- Existing high-energy data largely limited to deuteron photodisintegration
 - Provide complementary data for ³He breakup for better interpretation

E03-101

• 1-2 GeV region - D₁₃+F₁₅+... or 3-body mechanisms? ● >2 GeV region: Cross section originally overpredicted by all models (Brodsky et al. Phys Lett B578, 69-77, 2004) • HRM: recognized that original estimate neglected that two of the pp amplitudes have opposite signs and cancel • RNA/QGS: possible out - if reaction depends on SRC, 300-600 MeV/c nucleons - pn enhanced x20

 Hall A E03-101 data final, CLAS data being finalized, joint publication planned
 ≈ scaling, dσ/dt ≈s^{-18±1} vs. s⁻¹⁷ for Eγ>0.7 GeV

With CLAS data
preliminary, not too
worried about level of
agreement at present
Likely will need to look
more at CLAS vs. DAPHNE
probably DAPHNE issue

Hall A Collaboration Meeting, December 2010

> Does γ^{3} He \rightarrow pp+n_{spectator} violate scaling, as predicted by HRM?

---Prediction $s^{11}d\sigma/dt|_{4 \text{ GeV}}$ / $s^{11}d\sigma/dt|_{2 \text{ GeV}} \approx 2 \pm 10\%$, vs 1 vs E03-101 data: ≈ 1.5 ± 40% \checkmark Confirming the prediction, given the $\gamma d \rightarrow pn$ data, would be strong confirmation of underlying NN elastic scattering dynamics Hall A Collaboration Meeting, December 2010

R. Gilman

Friday, December 10, 2010

> Does γ^{3} He \rightarrow pp+n_{spectator} violate scaling, as predicted by HRM?

---Prediction $s^{11}d\sigma/dt|_{4 \text{ GeV}}$ / $s^{11}d\sigma/dt|_{2 \text{ GeV}} \approx 2 \pm 10\%$, vs 1 vs E03–101 data: $\approx 1.5 \pm 40\%$ \checkmark Confirming the prediction, given the $\gamma d \rightarrow pn$ data, would be strong confirmation of underlying NN elastic scattering dynamics Hall A Collaboration Meeting, December 2010

> What is the α_n distribution in $\gamma^{3}He \rightarrow pp + n_{spectator}$? momentum structure vs pQCD from short-range highmomentum structure of nuclei -E03-101 low statistics prevented measuring α_n $\sqrt{\alpha_n}$ provides nearly modelindependent check of underlying reaction dynamics Hall A Collaboration Meeting, December 2010

11

> Is the apparent scaling in γ^{3} He \rightarrow pd (A>2!) real? -Existing high energy data over limited range, E03-101 not optimized for pd -Apparent scaling at small E_{Y} and p_{T} , but big s -A number of highenergy exclusive reactions exhibit ≈scaling: not known why (if it is not pQCD) Hall A Collaboration Meeting, December 2010

Better determining onset of scaling gives another point in trying to understand why reactions scale or not, and more insight into 3-body effects
 2010 R. Gilman

> Why the ratio of scaling $\sigma_{pn}: \sigma_{pp}: \sigma_{pd} \approx 20: 1: 1/4?$ —Two inputs to the calculations: dynamics and nuclear structure \checkmark Measure γ^3 He \rightarrow pn +Pspectator to compare all reactions on 3He, and pn from d vs. 3 He, to be sure the nuclear structure is under control Hall A Collaboration Meeting, December 2010

✓ Tests 3-body mechanisms in γ^{3} He→pp+n_{spectator} for E_Y = 1 - 2 GeV ✓ More generally E_Y, θ dependence check nuclear effects in YNN

Summary • Request 19 days to measure $\gamma^{3}He \rightarrow pp + n_{spectator}$, $pn + p_{spectator}$, pd Largely standard Hall A photon experiment > Does γ^{3} He \rightarrow pp+n_{spectator} violate scaling, as predicted by HRM? Tests relation to NN elastic scattering > What is the α_n distribution in γ^3 He \rightarrow pp+n_{spectator}? Tests long vs short range underlying dynamics > Is the apparent scaling in γ^{3} He \rightarrow pd (A>2!) real? \checkmark Tests whether A>2 system scales > Why the ratio of scaling σ_{pn} : σ_{pp} : $\sigma_{pd} \approx 20$: 1 : 1/4? $\sqrt{\sigma_{pn}}$ from ³He tests nuclear structure inputs, 3 body and other nuclear effects

15

Note, not for PAC defense

> Bogdan's challenge: can we run with more open Bigbite / SBS / HC to increase solid angles and statistics? Lots of angle settings at 2.2 GeV, so only use SBS at 4.4 GeV SBS cannot be p/d arm - neutrons go through magnet iron but could be p arm. - For singles, reconstruction uncertainty dominated by $\delta\theta$, as long as $\delta p \leq 10^{-3}$. For coincidence, likely $\delta p \approx 10^{-2}$ OK; it needs study - HRS provides low backgrounds & high data quality. Our luminosities are high and we need to consider this as well. Might also make sense to use hadron calorimeter instead of HAND

Note, not for PAC defense

> Bogdan's challenge: can we run with more open Bigbite / SBS /

HC to incre \checkmark Lots of \bigcirc SBS cc but could -- For sin as $\delta p \leq 10$ -- HRS pr

luminositie

We need to evaluate these suggestions more and consider whether to make changes before the PAC.

Installation of SBS (+BB?) for 10 days probably does not make sense.

Using HC instead of HAND probably about same effort. as long

4 GeV

ron -

study

Might also make sense to use hadron calorimeter instead of HAND
