

Status Update

- Calculate the cross-section with acceptance
- Ryan showed some plots indicate that the spectrum is still not continuous for production data
- Need to figure out what causes this
- Difference between production target and carbon target

Acceptance Study

- Subtraction of dummy run effectively gives us a result with (production target - pure helium in the production target), but all the other stuffs outside the target cell has been removed
- The difference between the foil target and the extend target also need to be checked
- Simulate the target with 1 mm slices to see what is the difference in the acceptance
