

# Match Trajectories

Jixie Zhang

02/20/2013

# Background

- When transverse target field is on, event reconstruction goes back to only to the target end plane. Need to find out the vertex plane (or named it interaction plane) to do correction.
- Match Ytg to horizontal BPM does not help because Ytg resolution is larger than 1 mm.
- Match distance between BPM trajectory to the reconstructed trajectory MIGHT work (since it is 3-D matching instead of 1-D matching). This work is to try this method out ...

# 5.0T Target Field, $E=2.254$

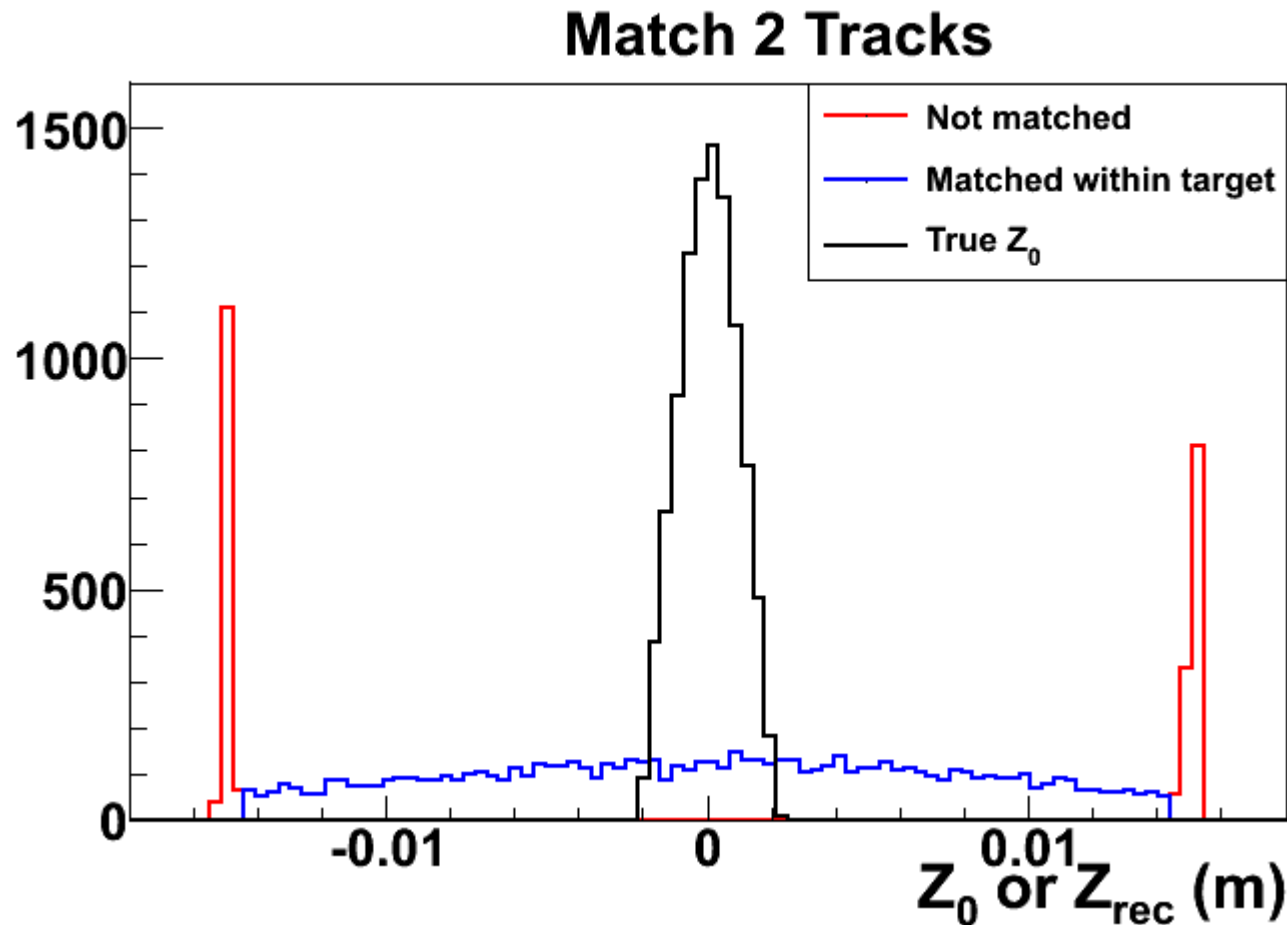

## Beam goes to the local dump

- Create vertex point  $V3X0(X0, Y0, Z0)$ , and  $V3P0$ , Swing it to the sieve
- Smear the sieve with SNAKE resolution (1 mm in position, 1 mrad in angle), then swing it back to the target end plane. Get position  $V3snake(Xsnake, Ysnake, Zsnake)$  and  $V3Psnake$ .
- BPM positions and angles at target end plane: Gaussian smeared  $X0, Y0$  by BPM resolution (1 mm).  $\theta_{bpm}$  and  $\phi_{bpm}$  come from a random gaussian with zero mean and 1 mrad sigma. Convert these values into Lab frame to get  $V3Xbpm$  and  $V3Pbpm$
- Reconstructed trajectory: swing from  $V3Xsnake$  and  $V3Psnake$
- Reconstructed trajectory: swing from  $V3Xbpm$  and  $V3Pbpm$
- Compare these 2 trajectories to get the most closest distance. Sign the variables of the matched point on the reconstructed track as  $\#rec$  ( $\#$  stands for x, y, z, theta, phi...). Sign the variables of the matched point on the BPM track as  $\#match$ .
- Will show the results in next few slices .....

# Matching 2 Trajectories

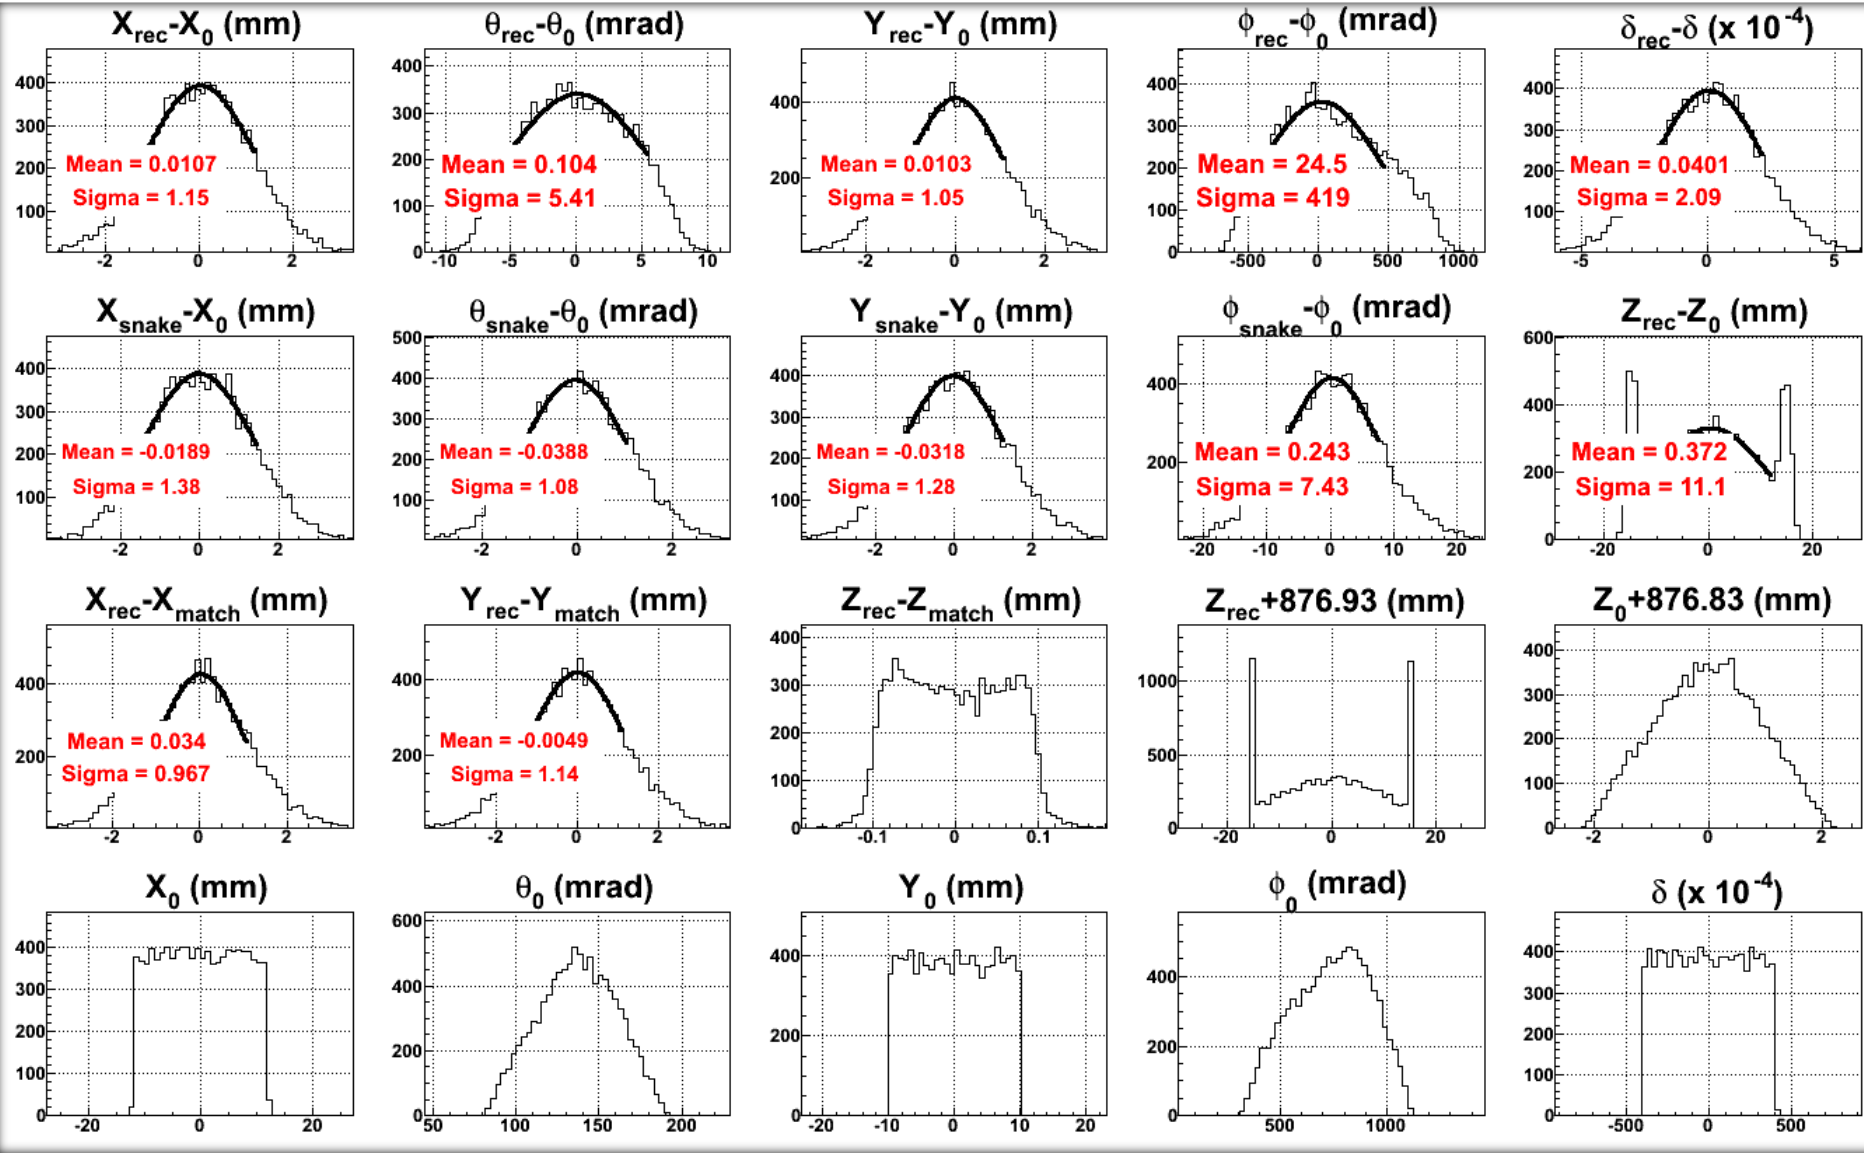

# How good is the result?

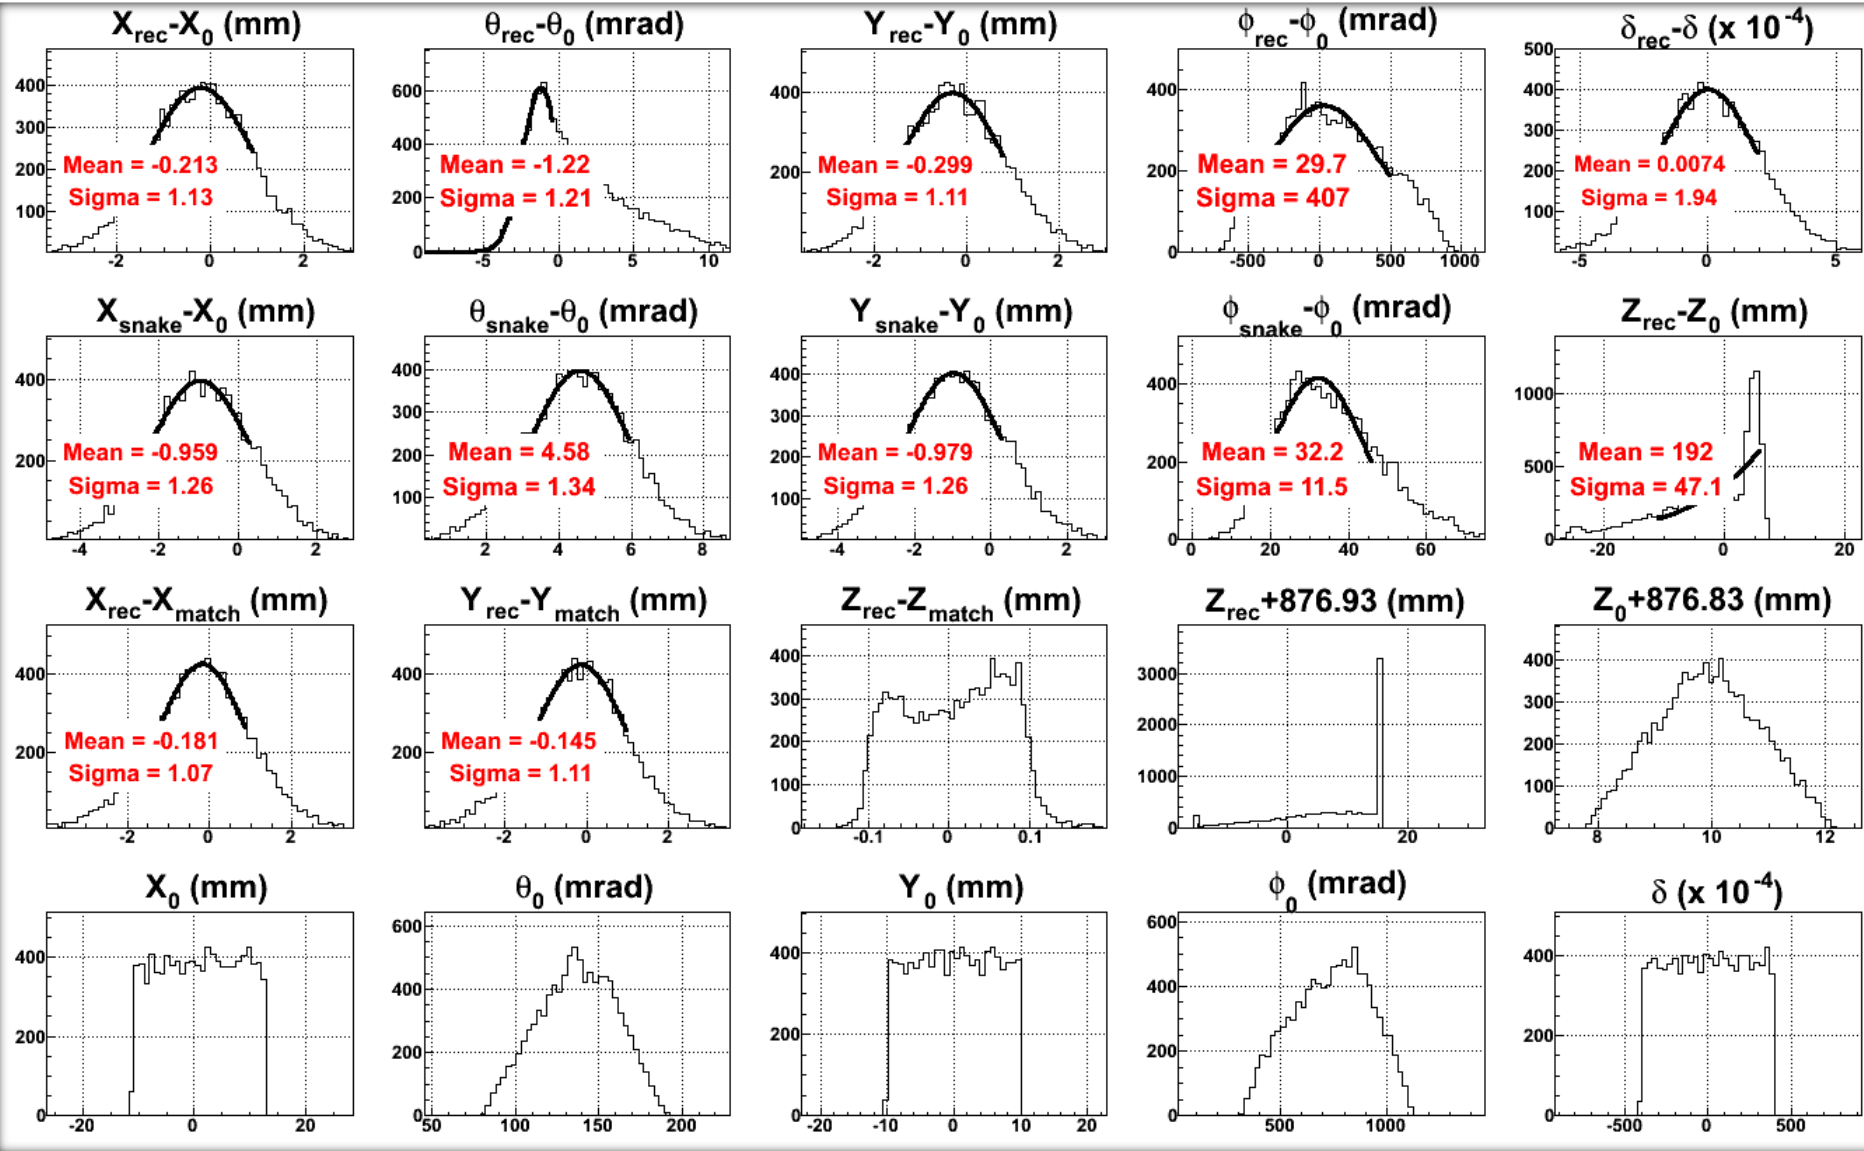

About 24% never matched. The other 76% will find the most closest point but no obvious peak exist within the target, which means no REAL match at all.

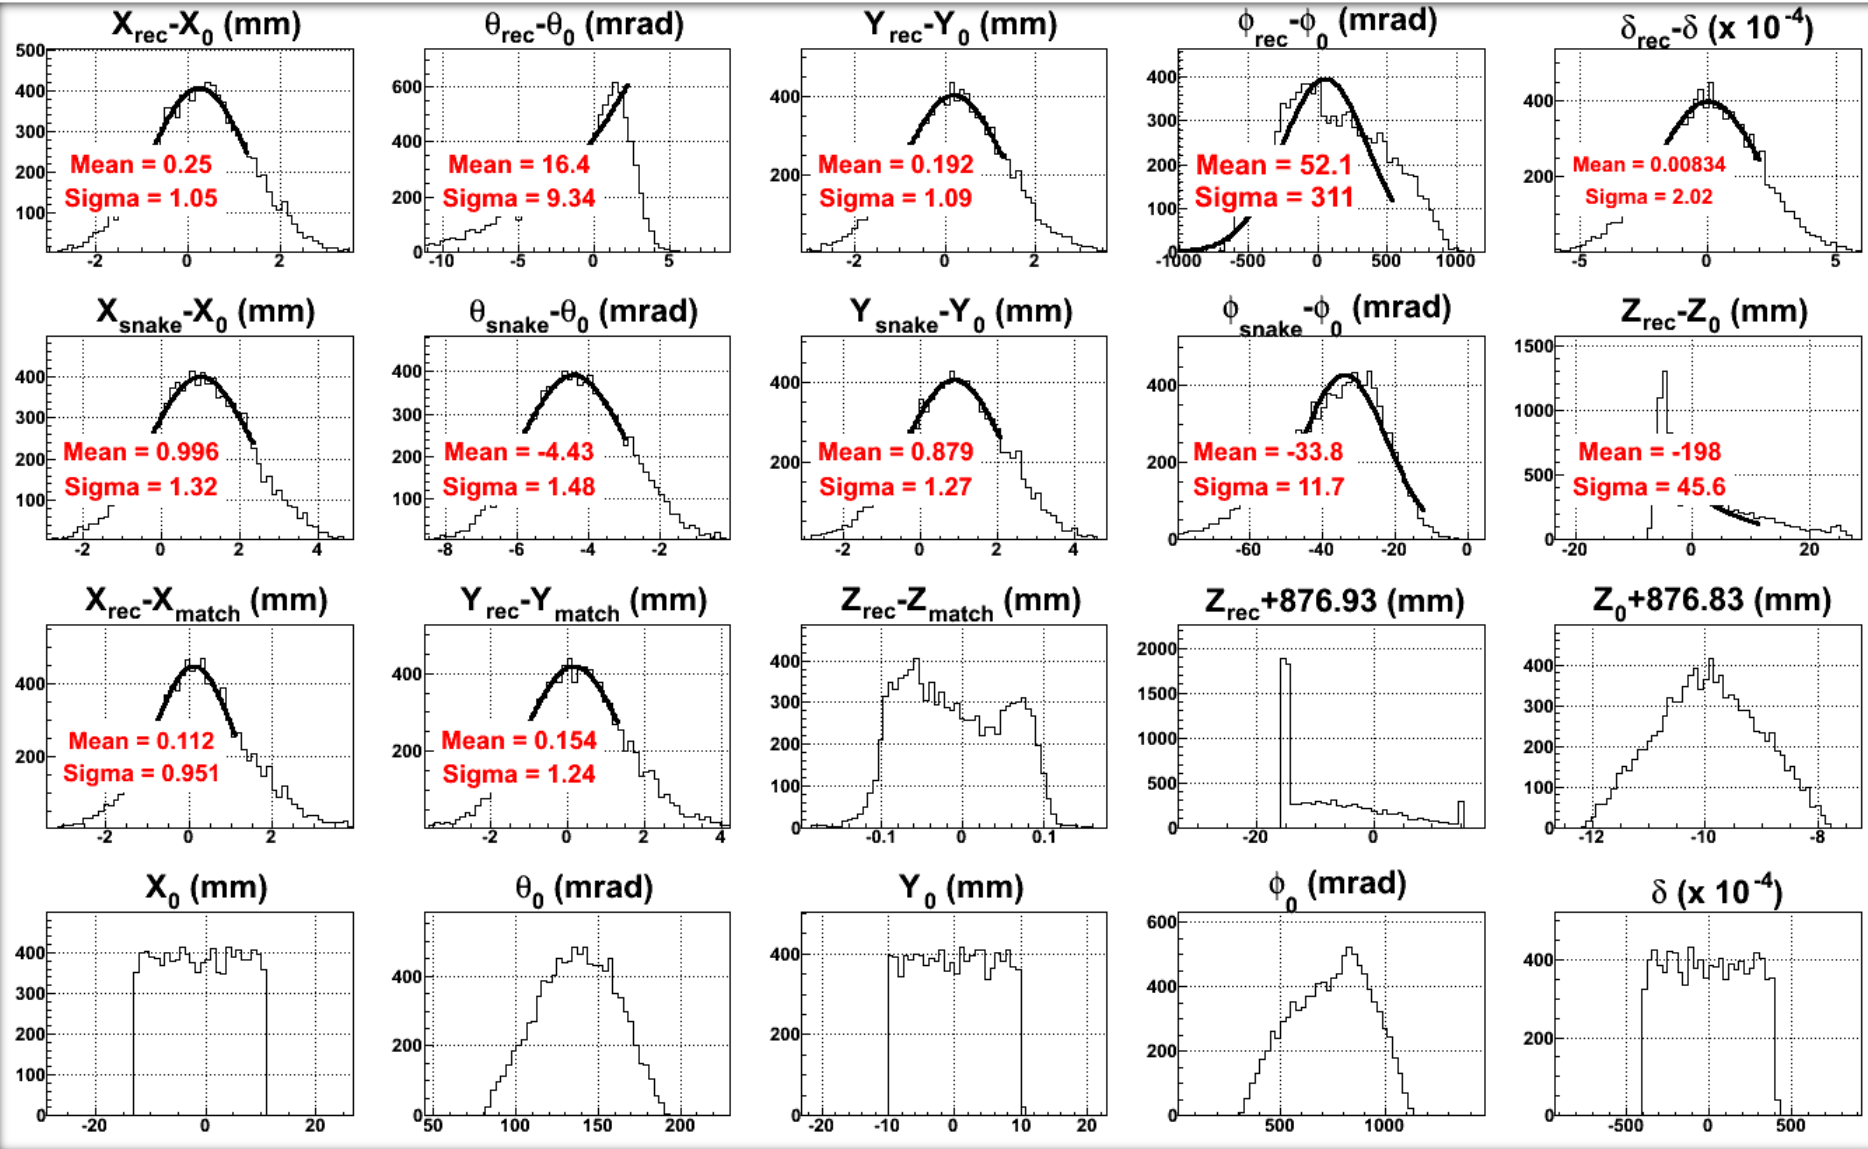

# 4 mm Slice at Target Center

# 4 mm Slice at 10 mm downstream

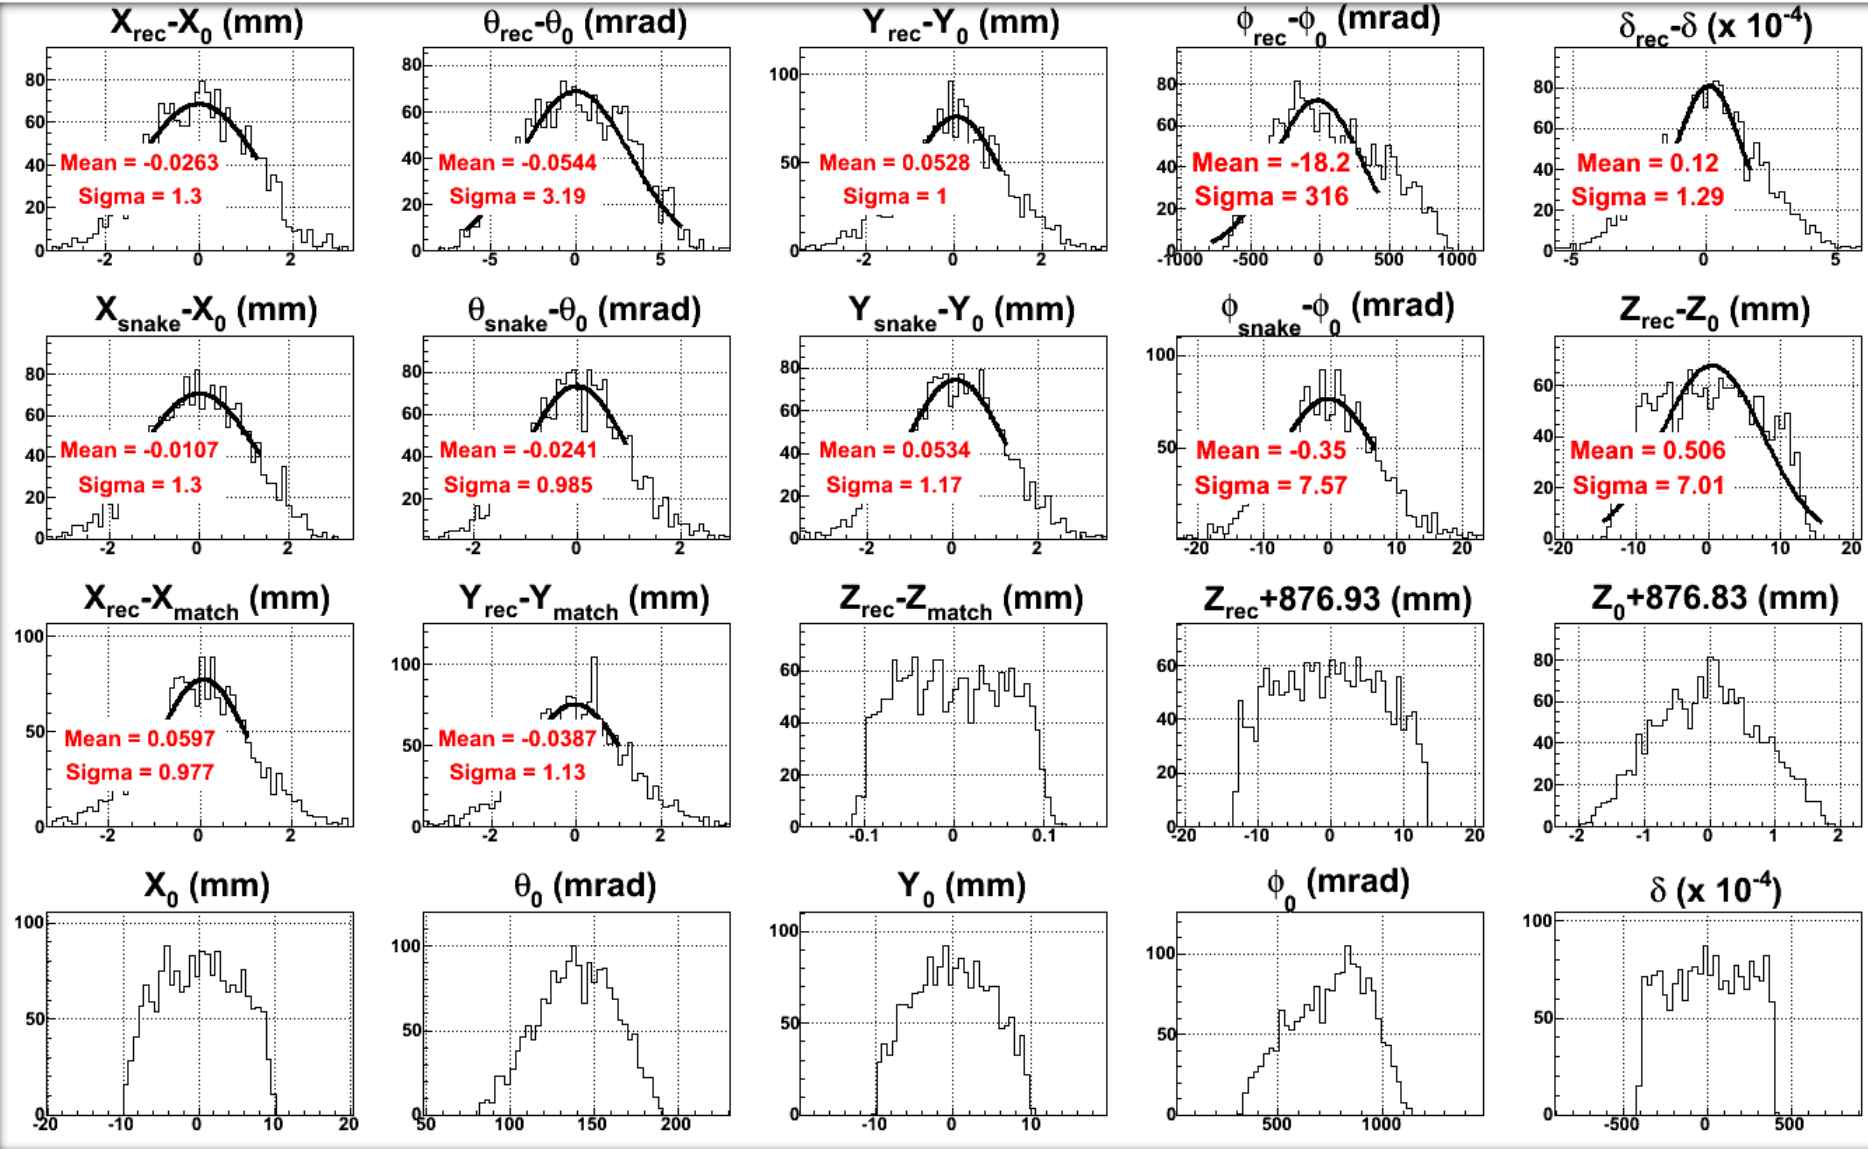

# 4 mm Slice at 10 mm upstream

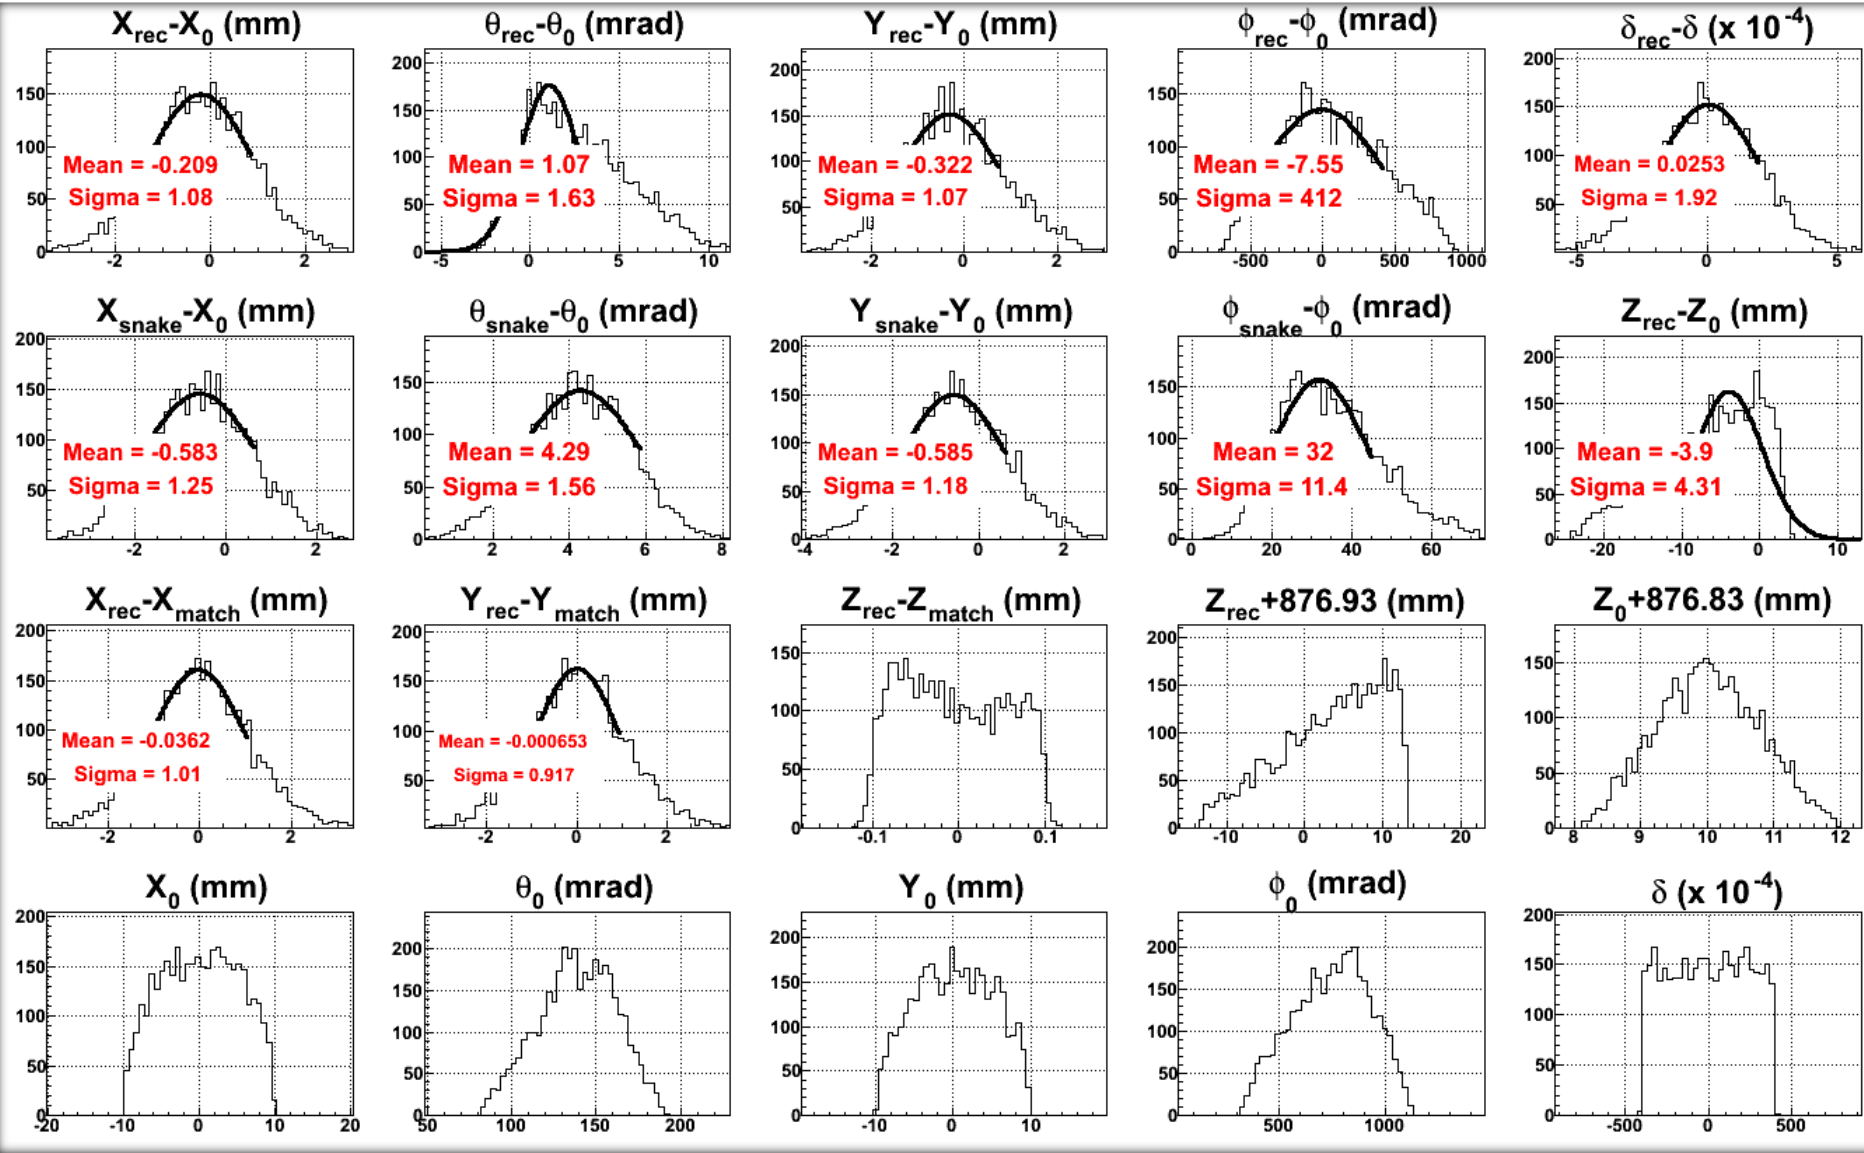

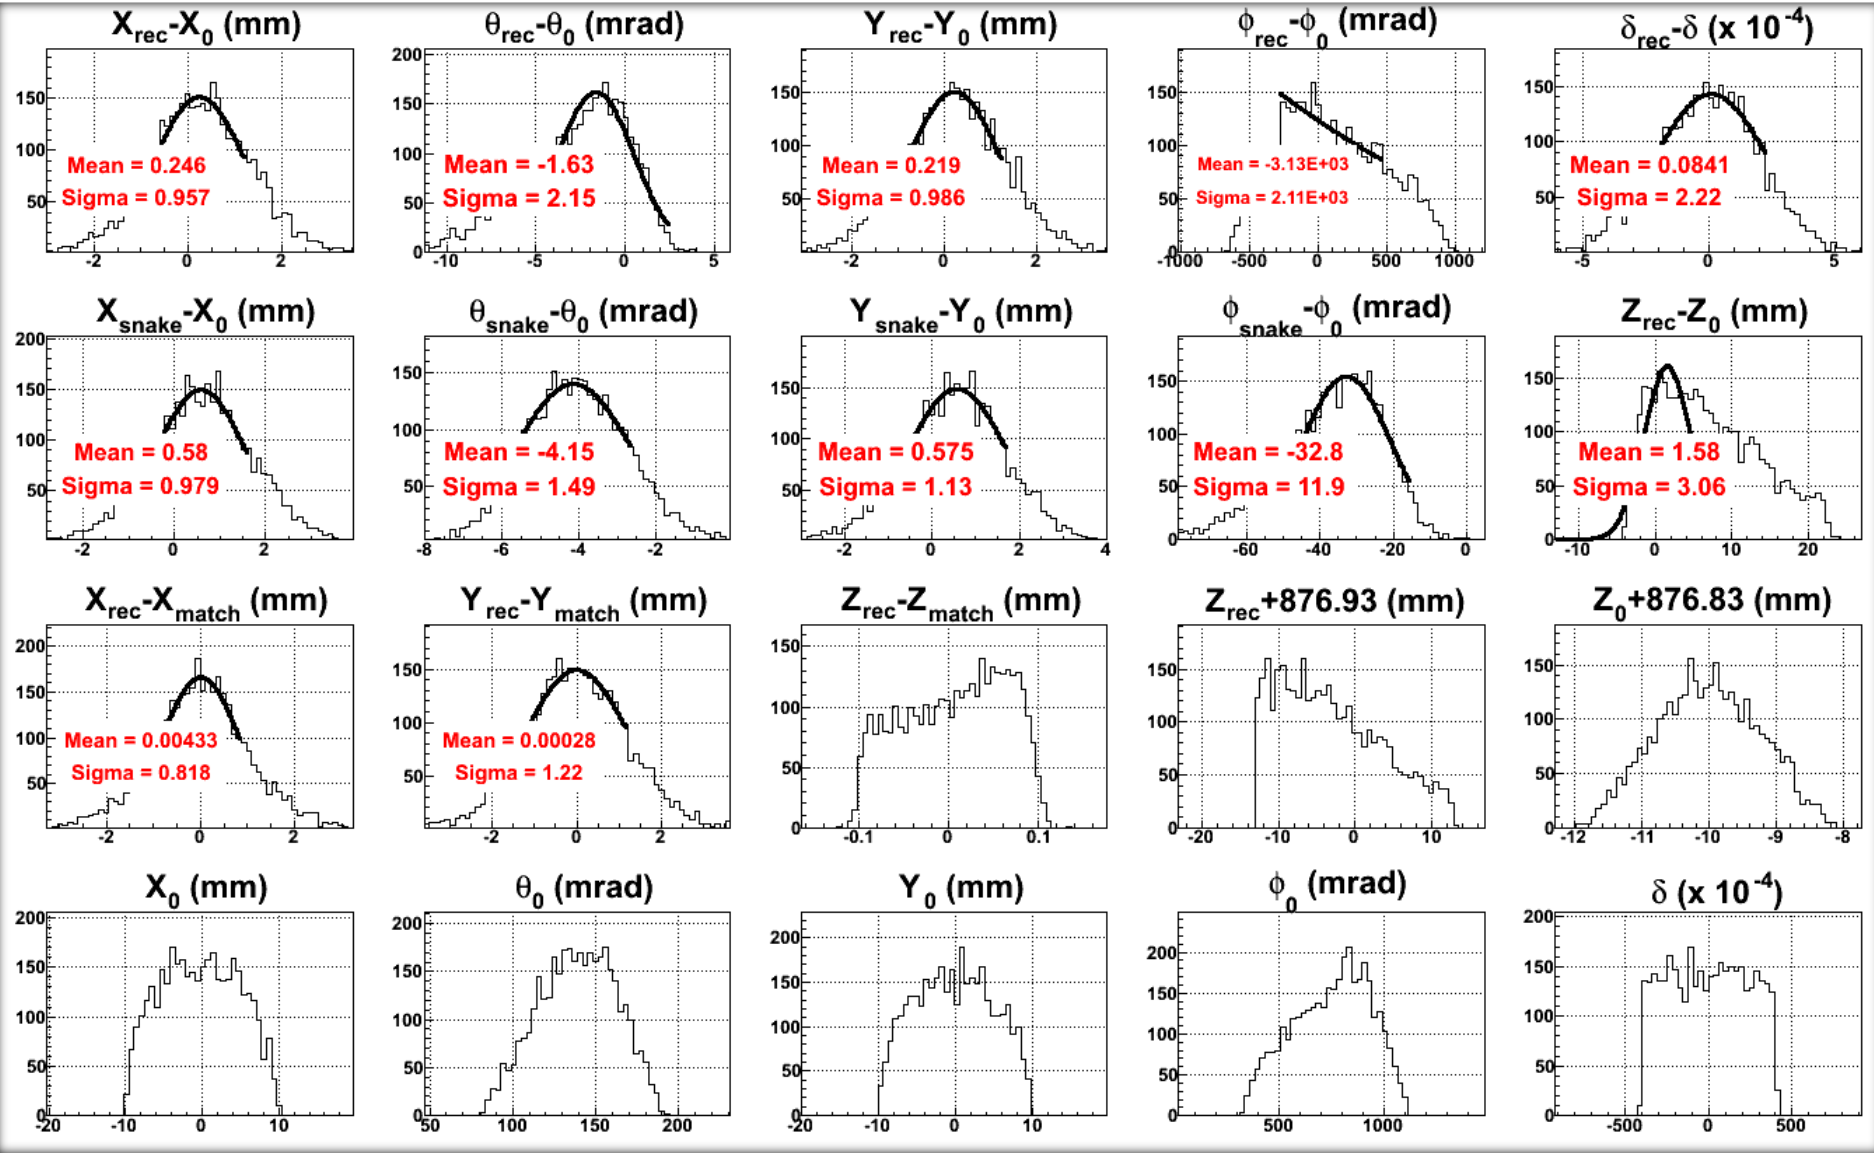

# 4 mm Slice at Target Center, CUT

# 4 mm Slice at 10 mm downstream, CUT

# 4 mm Slice at 10 mm upstream, CUT

# Conclusion

- Could there be any mistake in the method? Need more time to double check.
- If this work is correct, then we can say matching 2 trajectories in 3-D will not do anything better than matching in 1-D.
- Need some more good ideas.
