Summary Table

- 235 total settings (different momentum/material/HRS arm)
- 27 settings with spread > 5%
 - 11 of those have just 1 bad run
- Settings in yellow have a spread in yields that corresponds with beam down time

Material ID

- Added to mysql for production & packing fraction runs
- For runs where target encoder didn't read out, target position was determined from HALOG
 - 3 runs with conflicting information: 3504, 3769, 3865 (pf runs)

Quick Update on $P_b P_t$ Check

$$A \equiv \frac{\nu_z z^* G_M^2 + \nu_x x^* G_E G_M}{(\tau G_M^2 + \epsilon G_E^2) / [\epsilon(1 + \tau)]}$$

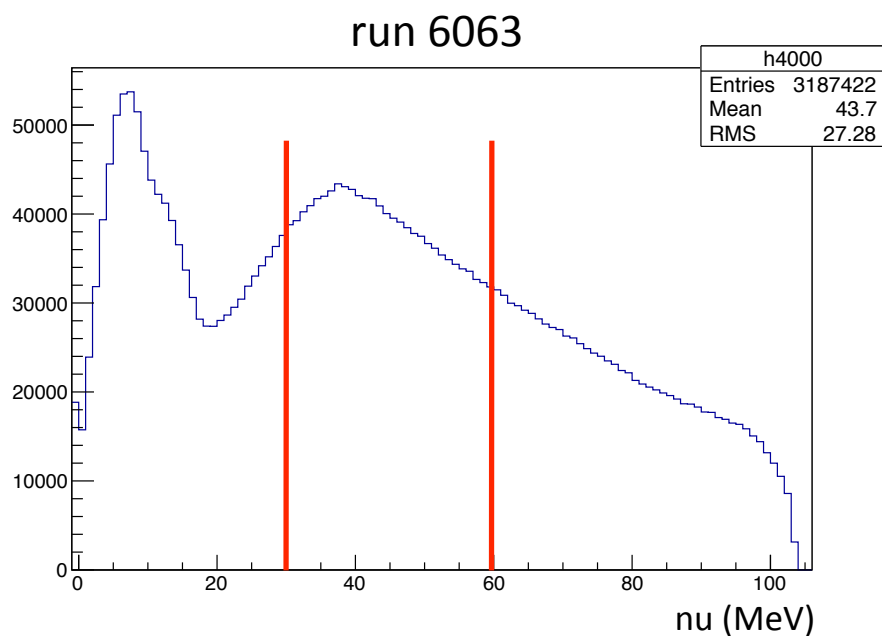

$$A = \frac{1}{f P_b P_t} A_{exp}$$

Form Factor Parameterization from:

“Relativistic Transverse Images of the Proton Charge and Magnetic Densities”,

Venkat/Arrington/Miller/Zhan (2010)

<http://arxiv.org/pdf/1010.3629.pdf>

For 2.2 GeV, 5T Transverse:

$$A_{pred} = -0.00521917$$

$$A_{raw} = 0.000607234$$

$$P_t = 66.2\% \text{ (average)}$$

$$P_b = 80.4\%$$

$$f = 0.22$$

still needs some work!
