Our wide variety of input, output, and combination modules makes the SLC 500™ family the smart choice for all of your small PLC applications.

I/O modules are available in a wide variety of densities including 4-, 8-, 16-, and 32-point and can interface to AC, DC, and TTL voltage levels. Output modules are available with solid state AC, solid state DC, and relay contact type outputs. For added flexibility, combination modules are also available in 2-input/2-output, 4-input/4-output, and 6-input/6-output versions.

Designed and tested for industrial applications, our modules are of the highest quality. The modules feature input filtering, optical isolation, and built-in surge protection to enhance the reliability of operation in noisy industrial environments.

Class I, Division 2 certified by UL and CSA. CE compliant. All modules are UL 508 listed and CSA 22.2 142 approved and meet Class I, Division 2 hazardous location requirements of both Underwriter's Laboratory and the Canadian Standards Association (except for those noted in the module summary on page 12). For use within the European Union or EEA regions, most modules have been tested to meet Council Directive 89/336 Electromagnetic Compatibility (exceptions are listed on page 12).

Features and Benefits

Terminal identification diagrams on each module. Terminal identification diagrams are located on each module making terminal identification easier.

LEDs indicate the status of each I/O point. Assisting you in troubleshooting, LEDs illuminate when the proper signal is received at an input terminal, or when the processor applies power to an output terminal.

High density 32-Point DC I/O and fast response DC inputs are available. These modules allow you to apply the SLC 500 processors in a broader spectrum of control applications.

All relay contacts are Silver Cadmium with Gold overlay. Gold plating resists oxidation and tarnishing resulting from non-use. Silver Cadmium acts as an excellent conductor.

Select I/O modules to exactly match your application. Combination modules allow you to have inputs and outputs in a single slot for efficient use of your chassis space.

Expand the I/O capacity of your fixed controller system. Two discrete I/O modules can be added to the fixed controller's 2-slot expansion chassis increasing the flexibility of the system.

Digital and field circuits are isolated. All modules feature isolation between digital and field circuits resulting in increased noise immunity, and limited damage to your system due to an electrical malfunction of the field wiring.

Self-lifting field-wire pressure plates cut installation time. Wiring terminals have self-lifting pressure plates to secure two #14 AWG field wires.

Removable terminal blocks help ease the wiring task. Removable terminal blocks allow you to replace the module without rewiring it (not available on all modules).

Removable terminal blocks are color coded for quick identification. A matching color band is also provided on the front of the module to assist in matching the terminal block to the module.

Barrier type terminal blocks provided on all modules. Each terminal block features a barrier on three sides of each terminal to help prevent accidental shorting of field wiring.

Self-locking tabs secure the module in the chassis. No tools are necessary to install or remove a module from the chassis. To install a module, you slide it into the chassis until it latches in place.

I/O Module Operation

Power Supply Requirements

Discrete modules receive power through the 1746 I/O chassis backplane from the associated chassis power supply. Refer to the individual module specifications for the current required from the power supply (in mA) to operate the module. You should total the current requirements for all the modules in the chassis to avoid overloading the power supply or the I/O chassis backplane.

Input Modules

An input module responds to an input signal in the following manner:

1. Input filtering limits the effect of voltage transients caused by contact bounce and/or electrical noise. If not filtered, voltage transients could produce false data. All input modules use input filtering.
2. Optical isolation shields backplane circuits and module logic circuits from possible damage due to electrical transients.
3. Logic circuits process the signal.
4. An input LED turns on or off indicating the status of the corresponding input device.

Output Modules

An output module controls the output signal in the following manner:

1. Logic circuits determine the output status.
2. An output LED indicates the status of the output signal.
3. Optical isolation separates module logic and backplane circuits from the field signal.
4. The output driver turns the corresponding output on or off.

Surge Suppression

Most output modules have built-in surge suppression to reduce the effects of high voltage transients. However, we recommend that you use an additional suppression device if an output module is being used to control an inductive device such as:

- relays
- solenoids
- motor starters
- motors

Additional suppression is especially important if your inductive device is in series with or parallel to a hard contact such as:

- pushbuttons
- selector switches

By adding a suppression device directly across the coil of an inductive device, you will reduce the effects of voltage transients caused by interrupting the current to that inductive device and prolong the life of the switch contacts. The diagram below shows an output module with a suppression device.

Recommended surge suppressors are provided in the specifications tables.

Important: Adding a suppression device across your load will defeat the fast turn-off feature of the 1746-OBP16 and -OVP16 DC output modules. Refer to pages [28](#) and [31](#) for more information about suppression when using the 1746-OBP16 and -OVP16, respectively.

Enhanced Discrete I/O Modules

32-Point Modules (1746-IB32, -IV32, -OB32, -OV32)

The 32-point I/O modules allow you to reduce panel space requirements by wiring 32 DC input or 32 DC output devices to a module residing in one slot. These modules can be used with both modular chassis systems or fixed controllers.

The 32-point modules come equipped with a 40-pin male connector on the front instead of screw terminals. This connector is designed to accept your cable fitted with the 1746-N3 mating connector. One 1746-N3 connector and 45 crimp type contacts are packaged with each module. The other end of the cable can be wired to a user-supplied terminal block.

As an alternative, 1492 prewired cables, purchased separately, can be used to connect the 32-point modules to 1492 interface modules. For more information, refer to the *Accessories* section on page 46.

Fast Response Input Modules (1746-ITB16, -ITV16)

The fast response DC input modules provide 16 input points and are designed for high-speed applications requiring fast response to input signals from DC sensing devices. When used with an SLC 5/03™ or SLC 5/04™ processor and the Discrete Input Interrupt (DII) instruction (100 µsec polling), pulses can be read up to a frequency of 1K Hz. (It is 2K Hz if the input signals are from a gray code encoder.) Recommended wiring to an Allen-Bradley 845D Absolute Gray Code Encoder is provided on page [21](#).

Both sinking and sourcing versions of the fast response input module are available.

High Current Solid State Output Modules (1746-OBP8, -OAP12, -OBP16, -OVP16)

High current solid state output modules expand application coverage for the SLC 500 by providing the following enhanced functionality:

- increased current rating
- fuse protection and diagnostics
- high-speed switching
- excellent reliability

The high current solid state output modules expand application coverage in automotive, packaging, and material handling applications by allowing the SLC 500 processor to directly control solenoids, contactors, motors, and motor starter loads (up to size 5) with continuous current requirements of up to 1A at 60°C (1746-OAP12, -OBP16, -OVP16) and 2.0A at 60°C (1746-OBP8).

1746-OAP12, -OBP16, and -OVP16 modules also provide fuse protection and blown fuse diagnostics for increased up-time. The ac output module includes two replaceable fuses (one per common), which protect the module in the event of short circuits.

1746-OBP16 and -OVP16 output modules include a replaceable fuse on the common providing short circuit protection for wiring (16 AWG or larger) to external loads. A jumper can be set on these modules to provide CPU notification and system shutdown if the module fuse blows. The modules also include a blown fuse LED to assist I/O troubleshooting.

Inductive load turn-off time for 1746-OBP16 and -OVP16 DC output modules is reduced by 70% over standard 1746 DC output modules allowing fast application cycle times.

Innovative heat sink design for the OAP12 allows heat to be dissipated through the chassis frame metal providing cool operation and excellent reliability.

Product Data

Discrete Input and Output Modules

Terms and Symbols Used in the Specification Tables and Wiring Diagrams

Terms

Backplane Current Draw — the amount of current the module requires from the backplane. The sum of the backplane current draw for all modules in a chassis is used to select the appropriate chassis power supply.

Continuous Current Per Module — the maximum current for each module. The sum of the output current for each point should not exceed this value.

Continuous Current Per Point — the maximum current each output is designed to continuously supply to a load.

Inrush Current — the temporary surge current drawn when an input is initially energized.

Minimum Load Current — the lowest amount of current the output is designed to operate at. Operating at or below this value is not recommended.

Nominal Input Current — the current drawn at nominal input voltage.

Off-State Current — for input circuits, the maximum amount of leakage current allowed from an input device that will keep the SLC™ input circuits in their off-state.

Off-State Leakage — for output circuits, the maximum amount of current present at the output terminal when the output circuit is in its off-state.

Off-State Voltage (max) — the maximum input voltage level detected as an OFF condition by the input module.

On-State Voltage Drop — the voltage developed across the output driver circuit during the ON state at maximum load current.

Operating Voltage — for inputs, the voltage range needed for the input to be in the on-state. For outputs, the allowable range of user-supplied voltage.

Points per Common — the number of input or output points connected to a single return (common) or supply (vcc).

Signal Delay — for inputs, the response time required to transmit the circuit status from the field logic to the digital logic. For outputs, the time required to transmit the circuit status from digital logic to the output driver.

Sinking/Sourcing — describes a current signal flow relationship between field input and output devices in a control system and their power supply. Sourcing I/O modules supply (or source) current to sinking field devices. Sinking I/O modules receive (or sink) current from sourcing field devices.

Surge Current — the temporarily large current drawn by an inductive output device when it is initially energized.

Surge Current Per Point — the maximum amplitude and duration (pulse) of current an output can provide to an inductive output device.

Voltage Category — the nominal voltage used to describe the module.

I/O Wiring Symbols

Symbol	Device Name
	2-wire Input Device
	3-wire Input Device
	Solenoid Output
	Contact Relay Output
	TTL Logic Output

Related Publications: Detailed wiring diagrams for 1746 input modules and Allen-Bradley Series 9000 Photoelectric Sensors are provided in Publication 42GR-7.4.

Important: The wiring diagrams in this document are examples only. It is not necessary to connect an I/O device to every terminal on an I/O module's terminal block.

Wiring Diagrams

The 16-point I/O module wiring diagrams include both decimal and octal numbers for I/O addressing and wire identification. (See figure below.) The decimal numbers in the upper left portion of each box are used to wire your 16-point I/O module to an SLC system. The octal numbers in the lower right portion of the box are used for a PLC® system. (As shipped from the factory, the I/O module has a decimal address label on the inside of its door.) An octal label kit is included with your 16-point I/O modules or you can order a separate octal conversion kit to allow you to convert your module to the octal system.

Important: PLC systems use the octal labels. (See illustration below.)

Directions on how to install the labels are included in publication number 1746-5.3, Discrete I/O Modules Installation Instructions. These instructions are provided in a kit that's shipped with each discrete I/O module.

-OBP8
-OBP16

High Current Sourcing DC Output Module (1746-OBP8, -OBP16)

Voltage Category	Number of Outputs	Points per Common	Catalog Number	Backplane Current Draw		Signal Delay (max.) (Resistive Load)	Off-State Leakage (max.) ^②	Load Current (min.)	Continuous Current per Point (max.)	Continuous Current per Module (max.)	On-State Voltage Drop (max.)	Surge Current per Point (max.) ^{③⑥}
				5V	24V							
24V dc (Operating voltage 20.4 – 26.4V dc)	8	4	1746-OBP8 (RTB)	0.135A	0.0A	on = 1.0 ms off = 2.0 ms	1 mA	1 mA	2.0A at 60°C	8.0A at 0° to 60°C	1V at 2A	4A for 10 ms
	16	16	1746-OBP16 (RTB) ^{①⑤}	0.250A	0.0A	on = 0.1 ms off = 1 ms ^④	1 mA	1 mA	1.5A at 30°C 1.0A at 60°C	6.4A at 0° to 60°C	1V at 1A	4A for 10 ms

① A fused common and blown fuse LED are provided on this module. For replacement fuse, use catalog number 1746-F8 or Littlefuse 322010. Refer to page 7 for additional information.

② To limit the effects of leakage current, a loading resistor can be connected in parallel with your load. For 24V dc operation use a 5.6k ohm, 1/2W resistor.

③ Repeatability is once every 1 second at 30 °C. Repeatability is once every 2 seconds at 60°C.

④ This module provides fast OFF delay for inductive loads. Comparative OFF delay times for 1746-OB8/-OV8 and 1746-OBP16/-OVP16, when switching Bulletin 100-B110 (24W sealed) contactor, are: 1746-OB8/-OV8 OFF delay = 152 ms; 1746-OBP16/-OVP16 OFF delay = 47 ms.

⑤ Fast off delay for inductive loads is accomplished with surge suppressors on the OBP16 module. A suppressor at the load is not needed unless another contact is connected in series. If this is the case, a 1N4004 diode should be reverse wired across the load. This defeats the fast turn-off feature. See also footnote 4.

⑥ Surge current = 32A per module for 10 ms.

RTB = Removable Terminal Block.

Fixed I/O Chassis Module Compatibility

You can use either of two methods to determine whether the 2-slot, fixed I/O expansion chassis will support a specific combination of modules.

- tabular method
- charting method

The table on the following page represents combinations of modules and indicates whether or not each combination is valid. The chart on page 43 represents the region of operating current that the fixed I/O expansion chassis supports.

Important: When referencing either method on the following pages, be aware that there are certain conditions that affect the compatibility characteristics of the BASIC module (**BAS**) and the DH-485/RS-232C module (**KE**).

When you use the BAS module or the KE module to supply power to a 1747-AIC Link Coupler, the Link Coupler draws its power through the module. The higher current drawn by the AIC at 24V dc is calculated and recorded in the tables for the modules identified as **BASn** (BAS networked) or **KE_n** (KE networked). Make sure to refer to these modules if your application uses the BAS or KE module in this way.

Tabular Method

Using the table on the next page, locate both of the modules you plan to use in the fixed I/O expansion chassis. Follow the top row across until you find one of the modules. Then follow the left column down until you find the other module. The symbol shown in the table cell that marks their intersection gives you information you must know before installing the modules.

- ☐ • A dot indicates a valid combination.
- ☐ No symbol indicates an invalid combination.
- ☐ ▽ A triangle indicates an external 24V dc power supply may be required. (Refer to the Analog I/O Module User Manual, 1746-6.4.)

Discrete Input and Output Modules

[illegible]

Locate both of the modules you plan to use in the fixed I/O expansion chassis. Follow the top row across until you find one of the modules. Then follow the right column down until you find the other module. The symbol shown in the table cell that marks their intersection gives you information you must know before installing the modules.

- ☒ A dot indicates a valid combination.
- ☐ No symbol indicates an invalid combination.
- ☐ A triangle indicates an external power supply is required. (Refer to the Analog I/O Module User Manual, 1746-6.4.)

There are certain conditions that affect the compatibility characteristics of the BASIC module (**BAS**) and the DH-485/RS-232C module (**KE**).

When you use the BAS module or the KE module to supply power to a 1747-AIC Link Coupler, the link coupler draws its power through the module. The higher current drawn by the AIC at 24V dc is calculated and recorded in the tables under the column headings **BASn** (BAS networked) or **KE n** (KE networked). Make sure to refer to these columns if your application uses the BAS or KE module in this way.

When an isolated analog output module (1746sc-INO4I or 1746sc-INO4VI) is used in a fixed controller, you must provide an external power supply. The isolated analog input modules (1746sc-INI4I and 1746sc-INI4VI) cannot be used in a fixed controller.

Charting Method

The following chart depicts the range of current combinations supported by the fixed I/O expansion chassis. To use it, you must first determine the backplane current draw and operating voltage for both of the modules you plan to use in the chassis. You can get these specifications from the table alongside the chart. Next, plot each of the currents on the chart below. If the point of intersection falls within the operating region, your combination is valid. If not, your combination cannot be used in a 2-slot, fixed I/O chassis.

Example: Plot IN16 and NIO4V

IN16 = 0.085A at 5V dc

NIO4V = 0.055A at 5V dc and 0.115A at 24V dc

1. Add current draws of both modules at 5V dc to get 0.14A (140mA).
2. Plot this point on the chart above (140mA @ 5V dc).
3. Plot current draw at 24V dc (115mA @ 24V dc).
4. Note the point of intersection on the chart above (marked x). This combination falls within the valid operating region for your fixed I/O chassis.

Important: The NO4I and NO4V analog output modules may require an external power supply. Refer to your analog user's manual.

Environmental Specifications

Operating Temperature	0°C to 60°C (32°F to 140°F) ^①
Storage Temperature	-40°C to 85°C (-40°F to 185°F)
Operating Humidity	5% to 95% (non-condensing)
Noise Immunity	NEMA standard ICS 2-230
Vibration (Operating)	Displacement 0.015 inch peak at 5-57 Hz. Acceleration 2.5Gs at 57-2000 Hz
Shock (Operating)	30Gs (all modules except relay contact). 10Gs (relay contact modules, 1746-OW, -OX, I/O Combo).
Isolation ^②	1500 Volts
Certification ^{③④}	UL listed. CSA approved. CE compliant for all applicable directives when product or packaging is marked.
Hazardous Environment Class ^④	Class I Division 2 Hazardous Environment

① Exceptions are indicated with certain modules.

② Electro-optical isolation between I/O terminals and control logic

③ Some modules are not CE marked. See page 12.

④ All modules meet Class I, Division 2 requirements for hazardous location. Some modules are rated Class I, Division 2 by CSA only. See page 12.

Discrete I/O Power Dissipation

The table on the following page lists the power dissipation for all discrete I/O modules operating at nominal voltage. An explanation of the terms used in the table follows:

Watts per point — the heat dissipation that can occur in each field wiring point when energized at nominal voltage.

Minimum watts — the amount of heat dissipation that can occur when there is no field power present.

Total watts — the watts per point plus the minimum watts (with all points energized).

For examples on calculating system heat dissipation, refer to the SLC 500 Modular Hardware Style Installation and Operation User Manual (Publication 1747-6.2) or the SLC 500 Fixed Hardware Style Installation and Operation User Manual (Publication 1747-6.21).

Power Dissipation for All Discrete I/O Modules

Hardware Component	Catalog Numbers	Watts per Point	Minimum Watts	Total Watts
Input Modules	1746-IA4	0.27	0.175	1.30
	1746-IA8	0.27	0.250	2.40
	1746-IA16	0.27	0.425	4.80
	1746-IM4	0.35	0.175	1.60
	1746-IM8	0.35	0.250	3.10
	1746-IM16	0.35	0.425	6.00
	1746-IB8	0.20	0.250	1.90
	1746-IB16	0.20	0.425	3.60
	1746-IB32	0.20	0.530	6.90
	1746-IV8	0.20	0.250	1.90
	1746-IV16	0.20	0.425	3.60

	1746-OX8	0.825	2.59	8.60
	1746-OG16	0.033	0.90	1.50
Combination Input & Output Modules	1746-IO4	0.27 — per input pt. 0.133 — per output pt.	0.75	1.60
	1746-IO8	0.27 — per input pt. 0.133 — per output pt.	1.38	3.00
	1746-IO12	0.27 — per input pt. 0.133 — per output pt.	2.13	4.60

Accessories

The following accessories are available for use with Discrete I/O modules:

Catalog Number	Item	Description
1746-N2	Modular card slot filler	Helps prevent debris from entering the SLC enclosure that can cause shorts or improper operation.
1492-IFMxx	Feed-through interface modules	Connects electronic wiring (discrete I/O modules, particularly 16 and 32-point) to electric wiring (factory devices). Available with either 20 or 40 terminals.
1492-CABLExx	Cables: – 1 m. (3.3 ft.) – 2.5 m. (8.2 ft.) – 5 m. (16.4 ft.)	Connects directly to the 1492-IFMxx interface module and is available with a removable terminal block or a ready-to-wire free end.
1746-N3	Connector kit	This kit allows you to create your own cable (3.2 meters max.) if the Catalog Number 1746-C15 cable is not long enough. It contains one female connector and 45 crimp contacts. Note: 32-point modules are shipped with one connector kit.

Support Services

In today's competitive environment, when you buy any product, you expect that product to meet your needs. You also expect the manufacturer of that product to back it up with the kind of customer service and product support that will prove you made a wise purchase.

As the people who design, engineer and manufacture your Industrial Automation Control equipment, Allen-Bradley has a vested interest in your complete satisfaction with our products and services.

Allen-Bradley offers support services worldwide, with over 75 Sales/Support offices, 512 authorized distributors and 260 authorized systems integrators located throughout the United States alone, plus Allen-Bradley representatives in every major country in the world.

Contact your local Allen-Bradley representative for:

- sales and order support
- product technical training
- warranty support
- support service agreements

Notes

PLC is a registered trademark of Allen-Bradley Company, Inc.

Allen-Bradley, a Rockwell Automation Business, has been helping its customers improve productivity and quality for more than 90 years. We design, manufacture and support a broad range of automation products worldwide. They include logic processors, power and motion control devices, operator interfaces, sensors and a variety of software. Rockwell is one of the world's leading technology companies.
