

UNISTRUT®

Seismic Bracing

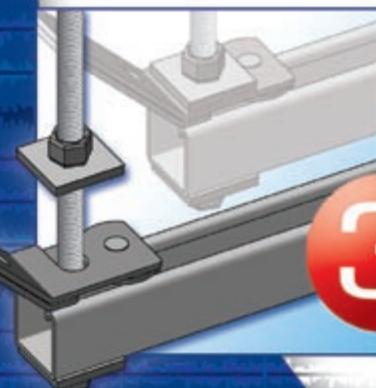

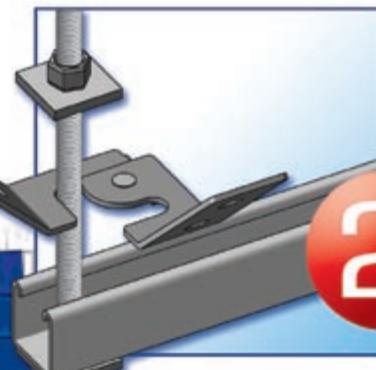

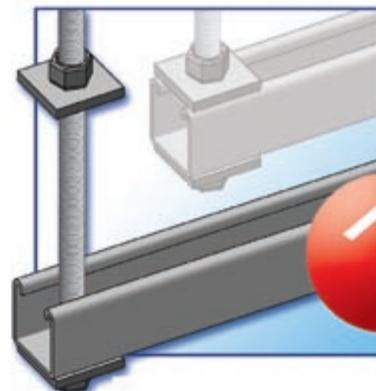

Meets California Building Code (CBC) 2001

As approved by the California Office
of Statewide Health Planning and
Development (OSHPD) for Metal
Framing Bracing Applications.

Introducing....

Retrofit seismic fasteners

A family of channel fittings that make retrofitting seismic bracing as easy as...

1. Move nut & washer up.
2. Slide fitting around rod.
3. Close fitting & bolt down.

Introduction.....	i
General Information	1-1
Glossary of Terms	1-3

Design Examples.....	7-1
Reference	8-1

UNISTRUT Seismic Bracing Systems are designed and constructed to resist virtually all code specified seismic forces in the event of an earthquake; therefore, keeping non-building structural components of hospitals and other essential facilities operational and intact.

Essential facilities are those structures, which are necessary for emergency post-earthquake operations. Such facilities shall include, but not be limited to: Hospitals and other medical facilities having surgery or emergency treatment areas; fire and police stations; municipal government disaster operation and communication centers deemed to be vital in emergencies.

Actual applications may vary and are not limited to support methods shown. However, any changes to the support methods, hardware and designs depicted in these guidelines should only be made in accordance with standard engineering practices by a qualified registered engineer and shall be approved by California Office of Statewide Health Planning and Development (OSHPD) or governing agency.

UNISTRUT bracing systems designed per the catalog requirements do not guarantee adequacy of existing structures to withstand the loads induced by the seismic attachments. It is the responsibility of the project engineer to verify that the structure is capable of supporting any and all items constructed using these guidelines. It is the responsibility of the project engineer and the installer to determine the adequacy of placement and installation in regards to these guidelines including compliance with all applicable codes.

Seismic bracing shall not limit the expansion and contraction of systems; the engineer of record shall ascertain that consideration is given to the individual dynamic and thermal properties of these systems and the building structure. Proper seismic & thermal joints should be provided as directed by the project engineer. The details and schedules presented do not include the weights from branch lines. All fire sprinkler branch line bracing shall comply with the requirements of the current edition of the NFPA-13. The project engineer must verify the additional load from branch lines are within the allowable capacity of the bracing details.

Where possible, pipes and conduit and their connections shall be constructed of ductile materials [copper, ductile iron, steel or aluminum and brazed or welded connection]. Pipes and their connections, constructed of other material, e.g. cast iron and no-hub pipe, shall have the brace spacing reduced to one-half of the spacing for ductile pipe.

Pipes, ducts and conduit supported by a trapeze where none of those elements would individually be braced need not be braced if connections to the pipe/conduit/ductwork and directional changes do not restrict the movement of the trapeze. If this flexibility is not provided, bracing will be required when the aggregate weight of the pipes and conduits exceed 10 lb/ft.

<p style="text-align: center;">APPROVED Fixed Equipment Anchorage Office of Statewide Health Planning and Development</p> <p style="text-align: center;">OPA-0120 Apr 25, 2003</p> <p style="text-align: center;">**** Valid for 3 Years Maximum ****</p> <p style="text-align: center;"> Bill Staehlin (916) 324-9106</p>	<p>makeitright™</p> <p>JOSEPH L. Walnut St. Suite 277 Arcadia, CA 91006</p> <p><i>[Signature]</i></p>	<p>UNISTRUT®</p> <p>35660 Clinton Street Wayne, Michigan 48184 PH: (800) 521-7730 FAX: (734) 721-4106</p> <p>DATE: 04/25/2003</p> <p>PAGE i</p>
---	--	--

- These guidelines are intended to provide information for the seismic restraint of nonstructural components in buildings based on the State of California Code of Regulations (CCR), Title 24. Material contained in this publication can be referenced in the 2001 California Building Code (CBC) based on the 1997 Uniform Building Code (UBC). Nonstructural components may include hospital piping, electrical conduit, cable trays, and air handling ducts. Anyone making use of the data does so at his own risk and assumes any and all liability resulting from such use. **UNISTRUT** disclaims any and all express or implied warranties of fitness for any general or particular application.
- Seismic horizontal force factor:

$$F_H = \frac{a_p C_a I_p}{R_p} \left(1 + 3 \frac{h_x}{h_r} \right) W_p \quad \text{Eqn. 2-1}$$

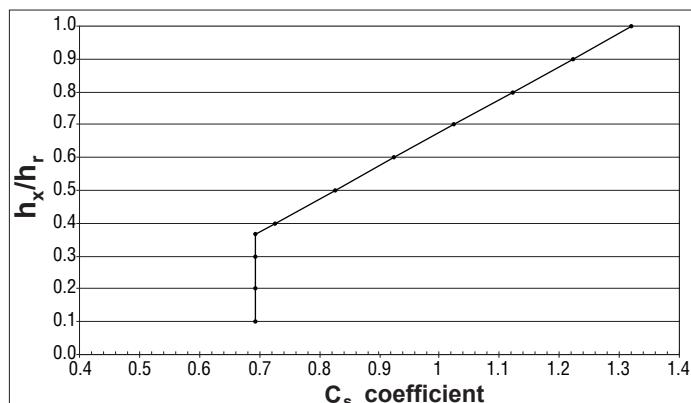

$$F_H = (C_s) W_p \quad \text{Eqn. 2-2}$$

$$F_H \text{ Limited by } : 0.7 C_a I_p W_p \leq F_H \leq 4 C_a I_p W_p \quad \text{Eqn. 2-3}$$

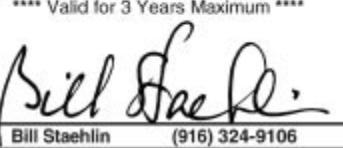

Factoring from Strength Design (F_H) to Working Stress (F_h) is necessary for Seismic Force to be used in this catalog. Use the following formula: $F_h = F_H / 1.4$.

The following Seismic Design Coefficient Graph is only applicable when all of the project's seismic coefficients/factors (e.g. a_p , C_a , etc.) are the same as those stated below. Otherwise use Eqn. 2-1 and 2-3 and reference the 2001 CBC.

a_p	= 1.0	<i>Component Amplification Factor</i>
C_a	= 0.66	<i>Seismic Coefficient</i>
I_p	= 1.50	<i>Seismic Importance Factor</i>
R_p	= 3.0	<i>Component Response Modification Factor</i>
h_x	= equipment attachment elevation with respect to grade	
h_r	= structure roof elevation with respect to grade	
C_s	= Seismic Design Coefficient (Graph 1 Below) = F_h / W_p (limits: $0.693 \leq C_s \leq 3.96$)	

Graph 1: SEISMIC DESIGN COEFFICIENT

APPROVED Fixed Equipment Anchorage Office of Statewide Health Planning and Development OPA-0120 Apr 25, 2003  **** Valid for 3 Years Maximum ****  Bill Staehlin (916) 324-9106	 JOSEPH L. LA BRIE Structural Engineer No. SE 3566 55 E. Walnut St. Suite 277 Arcadia, CA 91006  DATE: 04/25/2003	UNISTRUT® 35660 Clinton Street Wayne, Michigan 48184 PH: (800) 521-7730 FAX: (734) 721-4106 PAGE 1-1
---	--	--

3. When supporting pressure piping, spacing of seismic bracing should not exceed two (2) times the vertical support spacing. Stress in the pipes that are comparable to those required by ASME B31.1 will be maintained.
4. The CCR, Part 2, Title 24, Section 16 states the following:
Where possible, pipes, conduit, and their connections shall be constructed of ductile materials (copper, ductile iron, steel or aluminum and brazed or welded connections). Pipes, conduits, and their connections, constructed of nonductile materials (e.g., cast iron, no-hub pipe and plastic), shall have the brace spacing reduced to one-half of the spacing allowed for ductile pipe.

Seismic restraints may be omitted from the following installations:

- a. Fuel piping less than one (1) inch inside diameter.
- b. All other piping less than 2.5 inches diameter, except medical gas including vacuum piping, or
- c. All piping suspended by individual hangers twelve (12) inches or less in length from the top of pipe to the bottom of the structural support for the hanger, or
- d. All electrical conduit less than 2.5 inches trade size.
- e. All rectangular air handling ducts less than six (6) square feet in cross-sectional area, or
- f. All round air-handling ducts less than 28 inches in diameter, or
- g. All ducts suspended by hangers 12 inches or less in length from the top of the duct to the bottom of the structural support for the hanger, where the hangers are detailed to avoid bending of the hangers and their connection.

Where lateral restraints are omitted, the piping, ducts or conduit shall be installed such that lateral motion of the piping or duct will not cause damaging impact with other systems of structural members, or loss of vertical support.

5. UNISTRUT nuts and bolts mounted to UNISTRUT channels shall be tightened to the following minimum torques:

Bolt Diameter (in)	Bolt Torque (ft-lbs)
1/4	6
5/16	11
3/8	19

Bolt Diameter (in)	Bolt Torque (ft-lbs)
1/2	50
5/8	100
3/4	125

6. The charts and information presented on the following pages are intended as a guide only. Prior to installation, the user and/or engineer of record shall determine structural adequacy of supports and the supporting structure and shall also determine compliance with applicable codes.

A copy of this Seismic Bracing catalog showing the proper Seismic Brace tables and Brace Location Requirements (Page C3) along with the UNISTRUT Engineering catalog shall be on the jobsite prior to starting the installation of the seismic bracing system. The Seismic Tables defined in Pages 2-8 & 2-9 are for a seismic factor of 1.0g and can be used to determine brace location, sizes, and anchorage of pipe/duct/conduit and trapeze supports. The development of a new seismic table is required for seismic factors other than 1.0g and must be reviewed by OSHPD prior to seismic bracing. For OSHPD, these documents can be considered a change order in accordance with Part1, Title 24, CBC.

<p>APPROVED Fixed Equipment Anchorage Office of Statewide Health Planning and Development</p> <p>OPA-0120 Apr 25, 2003</p> <p>**** Valid for 3 Years Maximum ****</p> <p> Bill Staehlin (916) 324-9106</p>	<p>makeitright™</p> <p>JOSEPH L. 	<p>DATE:</p>	<p>04/25/2003</p>
		<p>PAGE 1-2</p>

Grade – Ground level of building; referred to as 0 ft elevation.

Lateral Brace – A generic term used to describe a brace that resist lateral forces in the longitudinal or transverse direction;

Lateral Force – Force acting on a component or element that is positioned across, perpendicular, or at a 90° angle to its vertical, in the horizontal direction.

Longitudinal– Direction along the horizontal axis of a component or element's run.

Shallow Anchors – Anchors with an embedded length to diameter ratio of less than 8.

SPF (Seismic Pivot Fitting) – A retro-fittable brace fitting used with strut or wire. Series SPF fittings are a trademark of Lord & Sons, Inc.

Run – Direction of pipe layout, along the axis of the pipe.

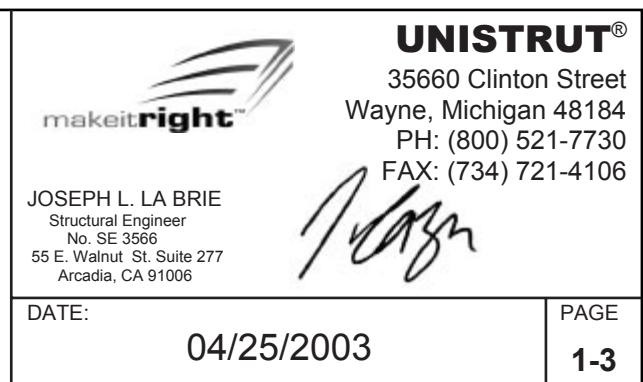

Strength Design – For load and resistance factor design; ultimate load (design for most critical effects of loads)

Sway Brace – A mechanical device used for resisting lateral forces.

Transverse– Direction perpendicular to the horizontal of a component or element's run.

Trapeze – Part of an assembly used to help resist seismic forces.

Working Stress – Allowable load used for design; factors down strength design loads, providing a safety factor. Generally, strength design forces/1.4.

NOTE:

1. THIS BRACING DETAIL APPLIES ONLY FOR COLD WATER PIPE AND GAS PIPE WHERE MOVEMENT OF THE PIPE DUE TO TEMPERATURE DIFFERENTIAL IS NEGLIGIBLE.
2. IT IS THE RESPONSIBILITY OF THE USER OF THIS GUIDELINE TO ASCERTAIN THAT AN ADEQUATE BRACING AND ANCHORAGE DEVICE BE DESIGNED FOR PIPE WHENEVER THE MOVEMENT DUE TO THERMAL DIFFERENTIAL AND SEISMIC JOINT OF BUILDING EXISTS.
3. TRANSVERSE BRACES FOR ONE RUN CAN BE USED AS LONGITUDINAL BRACES FOR AN ADJACENT RUN WHERE THE RUN OFFSET IS LESS THAN OR EQUAL TO 24"
4. TRANSVERSE BRACES FOR ONE RUN CAN BE USED AS TRANSVERSE BRACES FOR AN ADJACENT RUN WHERE THE RUN OFFSET IS LESS THAN OR EQUAL TO 24"
5. VERTICAL RUNS MUST HAVE TRANSVERSE BRACING IN EACH DIRECTION AT BOTH ENDS.
6. TRANSVERSE BRACE SPACING SHALL IN NO CASE EXCEED THE MAXIMUM CALCULATED DISTANCE OF 40ft.

(QUALIFIED CALCULATIONS REQUIRED)

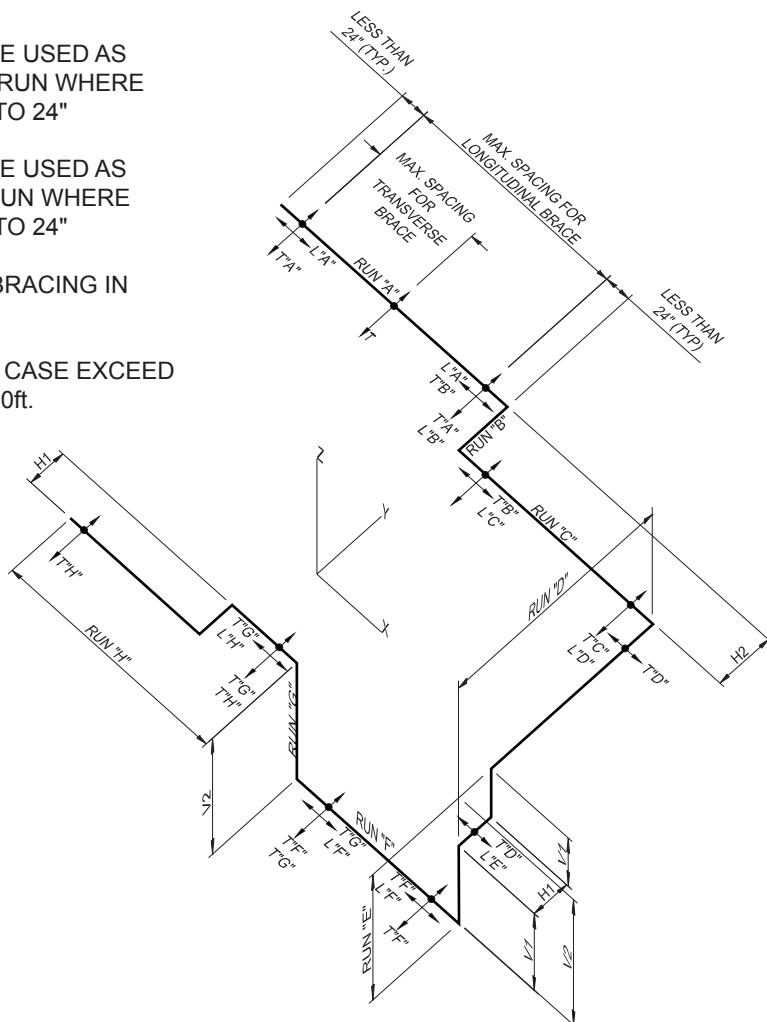

LONGITUDINAL BRACE SPACING IS TWICE TRANSVERSE SPACING BUT IN NO CASE SHALL THE MAXIMUM CALCULATED DISTANCE EXCEED 80ft.

(QUALIFIED CALCULATIONS REQUIRED)

7. REFERENCE PG 1-5 TO ADDRESS PIPING/CONDUIT HUNG FROM STRUCTURE ABOVE CONNECTING TO EQUIPMENT MOUNTED ON FLOOR BELOW.

DETAIL SHOWS PIPING/CONDUIT HUNG FROM STRUCTURE ABOVE CONNECTING TO EQUIPMENT MOUNTED ON FLOOR TO ADDRESS THE DIFFERENTIAL MOVEMENT BETWEEN STORY TO STORY.

APPROVED Fixed Equipment Anchorage <small>Office of Statewide Health Planning and Development</small> OPA-0120 Apr 25, 2003 **** Valid for 3 Years Maximum **** Bill Staehlin (916) 324-9106	UNISTRUT® 35660 Clinton Street Wayne, Michigan 48184 PH: (800) 521-7730 FAX: (734) 721-4106 JOSEPH L. LA BRIE Structural Engineer No. SE 3566 55 E. Walnut St. Suite 277 Arcadia, CA 91006 DATE: 04/25/2003
PAGE 1-5	

1. Determine the support spacing using the smallest pipe diameter (Page 2-3, Pipe Data Table).
2. Calculate the total weight of the pipes plus contents (W) on each trapeze using the following equation: (Page 2-3, Pipe Data Table)

$$W = S \times (p_1 + p_2 + p_3 + \dots + p_n)$$

W = Total weight on trapeze (lbs)
 p_n = Weight of pipe plus water (lbs/ft)
S = Support spacing (ft)

3. Calculate horizontal seismic force (F_h). Make necessary checks and conversion as defined in Page 1-1. Page 2-4, Figures 1 & 2 can be used as a reference when solving F_h .
4. Determine the actual brace force (maximum at 45°). Reference Page 2-7 for brace connection other than 45°.

$$F_{b\text{ Actual}} = F_h / \cos 45^\circ = 1.414 F_h$$

5. Select brace to be used, Rigid or Cable.

Select a channel fitting from Page 4-7 to 4-9.

Check brace against allowable design load (Page 4-6) and channel slip (Page 4-5). Use the lowest design load as the allowable brace force ($F_{b\text{ Allow}}$).

Determine if braces are required depending on type of brace used, Rigid or Cable:

6. Check compression and tension in the rod. When diagonal braces are used to stabilize trapeze hangers, they will cause tension and compression forces to be added to the tension already in the rod (see Page 2-4, Figure 1 or 2, or Page 2-7).
 - a. Select threaded rod that has a tension strength that meets or exceeds the required tension (Page 3-11, Capacity of Threaded Rod Table)

Brace on alternate hangers	$T_{\max} = .5W + s(2W)$	(Page 2-4, Figure 1)
Brace on every hanger	$T_{\max} = .5W + sW$	(Page 2-4, Figure 2)

- b. Check compression in the selected threaded rod. If the rod is subject to compression, it may require stiffener. Determine the percentage of full stress capacity on the rod using the following equation (Page 3-10 & Page 3-11):

$$\frac{\text{Actual Compression Load}}{\text{Allowable Compression Load}}$$

Select clip spacing (L) based on percentage above (Page 3-10, Channel Stiffener Table).

<p style="text-align: center;">APPROVED Fixed Equipment Anchorage Office of Statewide Health Planning and Development</p> <p style="text-align: center;">OPA-0120 Apr 25, 2003</p> <p style="text-align: center;">**** Valid for 3 Years Maximum ****</p> <div style="text-align: center;">  <i>Bill Staehlin</i> Bill Staehlin (916) 324-9106 </div>	<div style="text-align: center;">  JOSEPH L. LA BRIE Structural Engineer No. SE 3566 55 E. Walnut St. Suite 277 Arcadia, CA 91006 <i>J. LaBrie</i> </div> <div style="text-align: right; margin-top: -100px;"> UNISTRUT® 35660 Clinton Street Wayne, Michigan 48184 PH: (800) 521-7730 FAX: (734) 721-4106 </div>
	DATE: 04/25/2003 PAGE 2-1

7. Select pipe clamps (Pages 3-3, 3-4). Either style, P1100 Series or P2558 Series can be used.

Check forces on pipe clamps using the following equations:

$$\text{Vertical Force} = \text{Pipe Wt. per foot} \times \text{Trapeze spacing}$$

$$\text{Transverse Force} = F_h \times \text{Lateral Brace Spacing}$$

$$\text{Longitudinal Force} = F_h \times \text{Longitudinal Brace Spacing}$$

Revise spacing of braces if necessary (not to exceed allowable design forces).

8. Select trapeze member using the total weight on the trapeze and the length of trapeze required to fit the given pipe sizes and quantities (Page 3-1, 3-2, or 4-4).
9. Check trapeze member for combined vertical and lateral seismic loads using the following interaction equation: (Revise trapeze spacing or brace if necessary).

$$\frac{\left[\begin{array}{l} \text{Actual} \\ \text{Vertical Force} \end{array} \right]}{\left[\begin{array}{l} \text{Lateral} \\ \text{Reduction Factor} \end{array} \right] \times \left[\begin{array}{l} \text{Allowable} \\ \text{Vertical Force} \end{array} \right]} + \frac{\left[\begin{array}{l} \text{Actual} \\ \text{Horizontal Force} \end{array} \right]}{\left[\begin{array}{l} \text{Lateral} \\ \text{Reduction Factor} \end{array} \right] \times \left[\begin{array}{l} \text{Allowable} \\ \text{Horizontal Force} \end{array} \right]} \leq 1.33$$

10. Select concrete anchors if they are used (Page 6-1), check tension and shear interactions as per ICBO reports.

For shallow anchors: $(R_{p(3.0)} / R_{p(1.5)})F_H = 2F_H$

DATE: 04/25/2003 PAGE 2-5

1. Select hanger type (Pages 3-5 through 3-9) given the diameter of the pipe.
2. Determine the maximum hanger spacing (Page 2-3, Pipe Data Table). Calculate the total weight of the pipe and contents using the following equation:

$$W = S \times p$$

W = Total weight on hanger (lbs)

p = Weight of pipe plus water (lbs/ft)

S = Support spacing (ft)

3. Calculate horizontal seismic force (F_h) from the following,

$$F_h = C_s W$$

Refer to Page 1-1 and Check if within limits. Convert from strength design F_h to working stress F_h for values to be used in this catalog.

4. Check brace forces (max. at 45°) at every other hanger and select fittings from Page 4-6.

Reference Page 2-7 for brace connections other than 45°.

$$F_{b\ Actual} = F_h / \cos 45^\circ = 1.414 F_h$$

5. Select brace to be used, Rigid or Cable.

Check brace against allowable design load (Page 4-6) and channel slip (Page 4-5).

Select a fitting from Pages 4-7 to 4-9.

The lowest allowable design load (Allowable F_b) governs.

Determine if longitudinal braces are required using the following equation:

$$\text{Brace Spacing} = \text{Allowable } F_b / (1.414 F_h \times \text{hanger spacing})$$

6. Check tension of rod (reference Page 2-7):

$$T_{max} = W + F_y$$

$$F_y = K_y * F_h$$

Check compression: $\frac{\text{Actual Compression Load}}{\text{Allowable Compression Load}}$

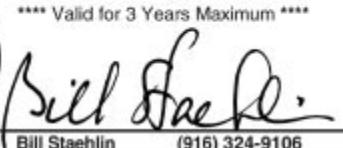

Select clip spacing (L) based on percentage above (Page 3-10, Channel Stiffener Table)

7. Verify pipe clamp capacity (use Design Table in Page 3-6)

$$\text{Actual Longitudinal Force} = F_h \times \text{Longitudinal Brace space}$$

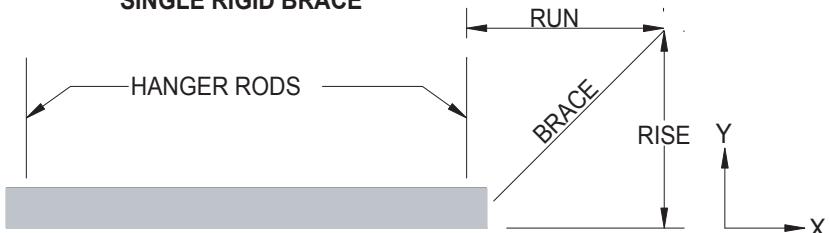

8. Select concrete anchors if they are used (See Page 6-1), check tension and shear interactions as per ICBO reports.

Note: For shallow anchors: $(R_{p(3.0)} / R_{p(1.5)}) F_h = 2F_h$

		2-7

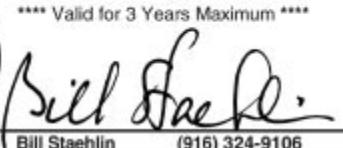

The following procedures are for the Seismic Tables defined in Pages 2-9 & 2-10 with a Seismic Factor of 1.0g. The Sample Procedure in Pages 2-1 & 2-6 provides a detailed description for determining bracing of Trapeze and Individually supported Water Filled Pipes, when variation of components or the use of seismic factors other than 1.0g is required for design.

STEPS PROCEDURE FOR USE OF SINGLE PIPE SEISMIC TABLE

1. Determine size of pipe to be braced.
2. Select type of Pipe Hanger to be used. Reference Page 3-5.
3. Determine transverse and longitudinal brace location requirements. Reference Pages 1-4 & 1-5.
4. From Single Pipe Seismic Table, obtain Maximum Brace Spacing, Minimum Rod Diameter, & Limiting Brace Length.
5. Determine type of structure (concrete, wood, steel) and from the table select Anchorage quantity, size, & embedment (where applies).

STEPS PROCEDURE FOR USE OF TRAPEZE SEISMIC TABLE

1. Determine the maximum vertical load distributed uniformly on the trapeze from pipe(s) being braced.
2. Knowing the pipe size(s), select the type and length of Trapeze from the Trapeze Seismic Table.
3. From the table, select Maximum Transverse Brace Space and Minimum Rod Diameter.
4. Determine transverse and longitudinal brace location requirements. Reference Pages 1-4 & 1-5.
5. Determine type of structure (concrete, wood, steel) and from the table select Anchorage quantity, size, & embedment (where applies).

5	J1250	9	9			5/8																
6	J1260	6	6																			
8	J1280	4	4																			

NOTES:

1. System must be engineered for variation of components (ie: size, quantity, spacing) needed to the listed values that are outside the scope of this table.
2. Pipe (water filled), see Page 2-3 for pipe properties.
3. Pipe Hanger capacity and details, see Pages 3-5 to 3-9.
4. Brace location requirements, reference Page 1-4.
5. Maximum support rod spacing per ASME B31.1, reference Page 2-3.
6. Maximum P1000 allowable brace length is 10 ft. at maximum brace angle of 45°.
7. 1/2" bolt(s) and nut(s) required on brace connectors attached to channels in this catalog.
(refer to Page 4-5 for allowable loads of nut in channel)

40		3	8	5																			
41, 44, 45		3	7	5																			
48, 49, 50		2	6	4																			

- Notes:
1. System must be engineered for variation of components (ie: size, quantity, spacing) needed to the listed values that are outside the scope of this table.
 2. Maximum vertical load (plf) simulates linear load of pipe(s) along pipe axis uniformly distributed on trapeze.
 3. Maximum Longitudinal Brace Space is 2x Transverse Brace Space, not to exceed 80 ft.
 4. Maximum Trapeze Lengths are for Uniform Load Capacities of Trapeze (see Pages 3-1, 3-2, 4-4) braced longitudinally. (When loads are concentrated at or near midspan of trapeze use 1/2 of maximum trapeze length defined in table (min. of 2ft).
 5. For non-braced Trapeze: type, length, & use of smaller components can be acquired, reference Note 1.
 6. Maximum P1000 allowable brace length is 10 ft. for loads listed in table.
 7. Maximum Hanger Spacing = 10ft.
 8. 1/2" bolt(s) and nut(s) required on brace connectors attached to channels in this catalog.
 9. Minimum 3,000 psi normal weight and light weight concrete slab/deck.

**VERTICAL BRACING OR STIFFENER LOAD TABLE**

Rod Size In.	Root Area In. ²	Root Diameter In.	Radius of Gyration In.	Max. Allowable Rod Compression Lbs. @ 100%	Clip Spacing L (In.)			Max. Seismic Safe Load* Lbs.
					Rod Stress at 50% 4,500 PSI	Rod Stress at 75% 6,750 PSI	Rod Stress at 100% 9,000 PSI	
3/8	0.068	0.314	0.0785	610	14	12	10	810
1/2	0.126	0.425	0.1063	1,130	20	16	14	1,500
5/8	0.202	0.536	0.1341	1,810	24	20	16	2,410
3/4	0.302	0.652	0.163	2,710	30	24	20	3,610
7/8 ⁴	0.419	0.73	0.192	3,770	35	28	25	5,030
1 ⁴	0.552	0.838	0.22	4,960	40	33	28	6,610

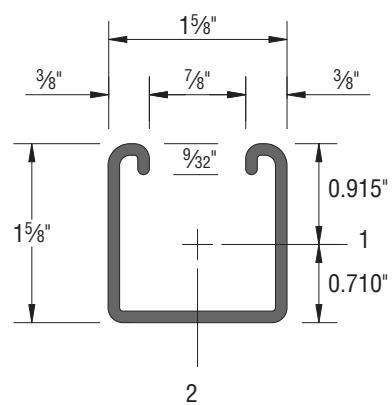

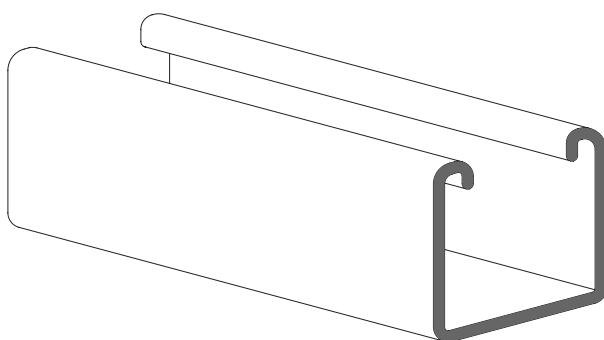

Assumptions:

1. Rod held against translation at location of cradle clips K equals 1.0.
 2. L = Distance between connection points.
 3. Trapeze with braces on alternate members.
 4. Must use U-Bolt detail, page 3-11.
- *5. Loads are based on the root area of the thread and at a stress of 9,000 psi.
- *6. Safe seismic forces are determined by increasing allowable safe loads by 33%

* Load Limited by Weld Shear

- Notes:
1. Calculations of section properties are based on metal thicknesses as determined by AISI, Cold-Form Steel Design Manual
 2. Prevent end rotation of beams that have vertical loads and lateral forces.
 3. When loads are concentrated at or near midspan, allowable uniform loads should be multiplied by 0.5 and deflections by 0.8
 4. Laterally unbraced beams should have allowable loads reduced by multiplying by the load reduction factor given in the last column.
 5. For short term seismic conditions apply a 33% increase in allowable loads.

2,000 lbs. (8.9 kN) Load Allowed in Each Foot of Length.
Reduce to 1,000 lbs (4.4kN) Load within 2" of Each End.

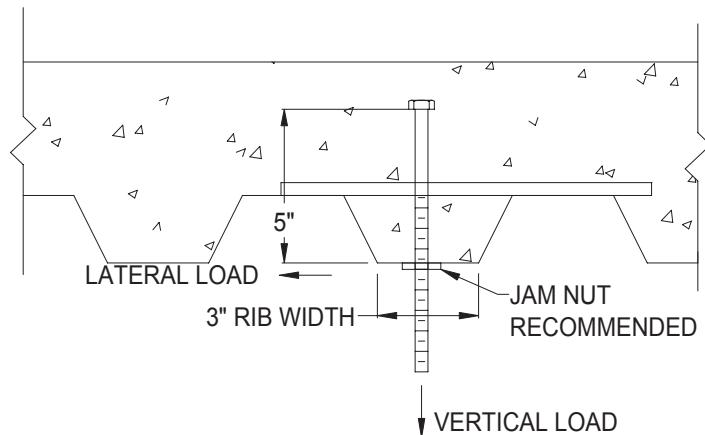

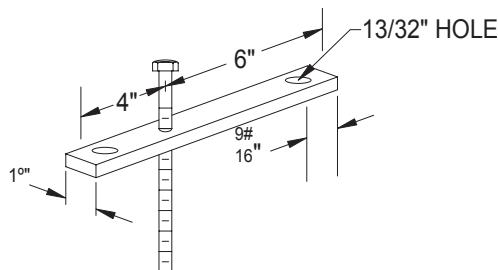

NOTE:

Recommended loading on inserts in 3,000 psi concrete. Sufficient concrete must surround inserts to conform to design sheer stress. The distance between the insert centerline and the concrete edge must be a minimum of 3".

Values in the Table are based on a safety factor of 3 to 1. For installation in Hospitals, use 65% of tabulated values. When installing underside of slab, use 50% of tabulated values.

**EXPANSION BOLT NOTES**

1. Drilled-in anchors shall be ITW Ramset/Red Head Self-Drilling per I.C.B.O. Report No. 1372, March 1, 2000. Other anchors may be substituted providing they have an I.C.B.O rating equal or greater than the values tabulated below. User should be using load stated in (most recent) I.C.B.O. report. Tabulated loads are for anchors installed in the tension (underside) zone of structural members (beams and slabs) and have been reduced per OSHPD guidelines.
2. Minimum concrete $f'_c = 3,000$ psi, normal weight.
3. Minimum embedment of all bolts shall be as shown below.
4. When installing drilled-in anchors and or powder driven pins in existing non-stressed concrete, use care and caution to avoid cutting or damaging the existing reinforcement bars. Maintain a minimum clearance of one inch between the reinforcement and the drilled in anchor and or pin.
5. All concrete expansion type anchor bolts (loaded in either pullout or shear) shall have 50 percent of the bolts (alternate bolts in any group arrangement) proof tested in tension to twice the allowable tension load. If any anchor fails testing, test all anchors of the same category installed by the same trade not previously tested until twenty (20) consecutive pass, then resume the initial testing frequency.
6. Use 50% of allowable tension when anchors are installed in the tension zone of the concrete. Project Engineer to verify.
7. Bolt spacing and installation shall conform to the requirements of the I.C.B.O. report.

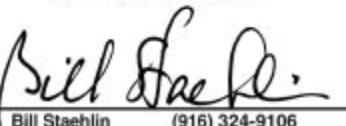

$$\text{Combined Interaction (i)} = \left(\frac{\text{Applied Service Tension Load}}{\text{Allowable Service Tension Load}} \right)^{\frac{5}{3}} + \left(\frac{\text{Applied Service Shear Load}}{\text{Allowable Service Shear Load}} \right)^{\frac{5}{3}} \leq 1$$

**EXPANSION BOLT TEST SPECIFICATIONS**

1. Anchor diameter refers to the thread size of the WEDGE category.
2. Apply proof test loads to WEDGE anchors without removing the nut if possible. If not, remove nut & install a threaded coupler to the same tightness of the original nut using a torque wrench and apply load.
3. Reaction loads from test fixtures may be applied close to the anchor being tested, provided the anchor is not restrained from withdrawing by the fixture(s).
4. Test equipment is to be calibrated by an approved testing laboratory in accordance with standard recognized procedures.
5. The following criteria apply for the acceptance of installed anchors:

HYDRAULIC RAM METHOD:

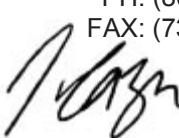

The anchor should have no observable movement at the applicable test load. For wedge and sleeve type anchors, a practical way to determine observable movement is that the washer under the nut becomes loose.

TORQUE WRENCH METHOD:

The applicable test torque must be reached within the following limits:

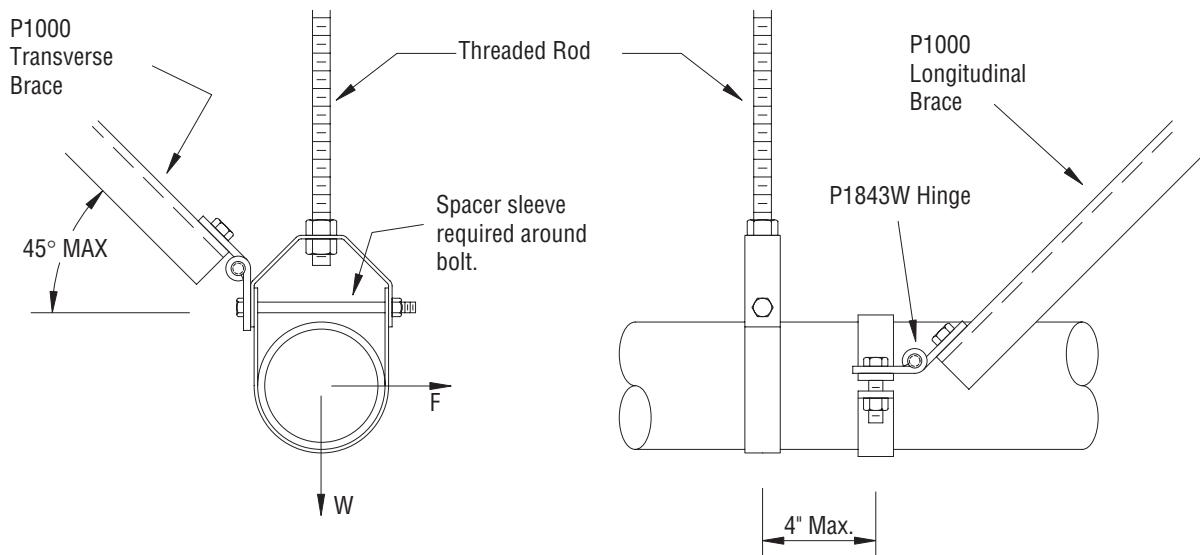

Wedge: One-half (1/2) turn of the nut.

6. Testing should occur 24 hours minimum after installation of the subject anchors.
7. All tests shall be performed in the presence of the Inspector of Record.
8. If manufacturer's installation torque is less than the test torque, use the installation torque in lieu of the tabulated values.

	<p>DATE:</p>	<p>04/25/2003</p>
		<p>PAGE 6-3</p>

Problem:

Design a brace for a single pipe hanger with 8" diameter pipe and hangers spaced at maximum distance (see figure below).

**Solution:**

Step 1 Select Clevis hanger for 8" diameter pipe (Page 3-7).

Step 2 (Page 2-3, Pipe Data Table) Determine the maximum hanger spacing (S):

$$S = 10 \text{ ft (On Center)}$$

the unit weight of the 8" pipe full of water (W):

$$W = 50.29 \text{ lbs/ft}$$

Step 3 Calculate horizontal seismic force (F_H):

If pipe placed above ceiling of 2nd floor (20 ft) of a 4 story (40 ft) building and is within the seismic limits defined in page 1-1, then C_s can be taken from Seismic Design Coefficient Graph, Page 1-1:

$$h_x = 20'$$

$$h_r = 40'$$

$$h_x/h_r = 0.5$$

$$C_s = 0.83$$

(within $0.693 \leq C_s \leq 3.96$)

$$F_H = C_s(W) = 0.83(50.29 \text{ lbs}) = 41.7 \text{ lbs/ft}$$

$$F_h = F_H/1.4 = 29.8 \text{ lbs/ft}$$

(converts to working stress loads)

APPROVED Fixed Equipment Anchorage Office of Statewide Health Planning and Development OPA-0120 Apr 25, 2003 **** Valid for 3 Years Maximum **** Bill Staehlin (916) 324-9106	makeitright™ JOSEPH L. LA BRIE Structural Engineer No. SE 3566 55 E. Walnut St. Suite 277 Arcadia, CA 91006 DATE: 04/25/2003	UNISTRUT® 35660 Clinton Street Wayne, Michigan 48184 PH: (800) 521-7730 FAX: (734) 721-4106 PAGE 7-1
---	--	--

Step 4 Actual brace force (maximum at 45°) at every other hanger,

$$F_{b\text{ Actual}} = 1.414F_h = 1.414(29.8 \text{ lbs/ft} \times 24 \text{ ft}) = 1011 \text{ lbs}$$

Step 5 Select rigid brace P1000.

Check brace against allowable design load:

From Page 4-6 (Brace Design Table), a Brace Span of 84" has a capacity of 1,850 lbs and is greater than $F_{b\text{ Actual}}$. **Therefore okay.**

Check slip along channel:

From Page 4-5 (Design Load Table) The maximum slip for a single bolt fitting P1843W is 1500 lbs ($>F_{b\text{ Actual}}$). **Therefore okay.**

Can use any brace length less than 84" to allow slip to be the limiting allowable load.

Therefore $F_{b\text{ Allowable}} = 1500 \text{ lbs.}$

Determine if longitudinal braces are required:

$$\begin{aligned} \text{Brace Spacing} &= F_{b\text{ Allowable}} / (1.414 \times F_h \times \text{hanger spacing}) \\ &= 1500 \text{ lbs} / (1.414 \times 29.8 \text{ lbs/ft} \times 10 \text{ ft}) \\ &= 3 \text{ Bays} \end{aligned}$$

Therefore, use hangers 10 ft on center, Transverse Brace on every other hanger, and Longitudinal Brace on every Transverse Brace.

Step 6 (Page 3-11, Capacity of Threaded Rod Table) Maximum Allowable Load (1/2" rod) = 1500 lbs,

Actual Seismic Load (T_{max}) = $W + (F_h \times 24 \text{ ft}) = 604 \text{ lbs} + (29.8 \text{ lbs/ft} \times 24 \text{ ft}) = 1319 \text{ lbs}$

Therefore okay.

Compression is not considered.

Step 7 Verify pipe clamp capacity.

$$\text{Longitudinal Force} = F_h \times \text{brace spacing} = 29.8 \text{ lbs/ft} \times 48 \text{ ft} = 1431 \text{ lbs}$$

From Page 3-6, an 8" pipe has a longitudinal capacity = 500 lbs

Since the 8" pipe longitudinal capacity is less than the actual longitudinal force, adjust longitudinal brace space:

$$\text{Longitudinal Force} = 29.8 \text{ lbs/ft} \times 12 \text{ ft} = 358 \text{ lbs}$$

Therefore, adjust Longitudinal Brace spacing to every hanger (12 ft on center).

APPROVED Fixed Equipment Anchorage Office of Statewide Health Planning and Development OPA-0120 Apr 25, 2003 **** Valid for 3 Years Maximum **** Bill Staehlin (916) 324-9106	 JOSEPH L. LA BRIE Structural Engineer No. SE 3566 55 E. Walnut St. Suite 277 Arcadia, CA 91006 	UNISTRUT® 35660 Clinton Street Wayne, Michigan 48184 PH: (800) 521-7730 FAX: (734) 721-4106 PAGE 7-2
DATE:	04/25/2003	

Step 8 Select concrete anchors for,

Vertical Supports – Actual Maximum Tension Load:

$$W \times \text{hanger spacing} = 50.29 \text{ lbs/ft} \times 12 \text{ ft} = 603.5 \text{ lbs.}$$

(Page 6-1) Select a $\frac{1}{2}$ " diameter $2\frac{1}{4}$ " Embedment Anchor:
Maximum Allowable Tension = 1220 lbs. **Therefore okay.**

Braces (45°) – Actual Brace Loads:

$$\text{Maximum Shear Load} = 29.8 \text{ lbs/ft} \times 12 \text{ ft} = 358 \text{ lbs for a } 45^\circ \text{ brace}$$

$$\text{Maximum Tension Load} = (1.414) 358 \text{ lbs} = 506 \text{ lbs for a } 45^\circ \text{ brace}$$

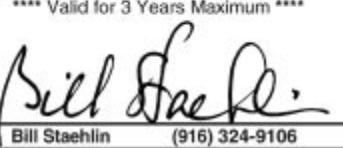

(Page 6-1) Select a $\frac{1}{2}$ " diameter $2\frac{1}{4}$ " Embedment Anchor:

$$\text{Allowable Shear} = 952 \text{ lbs.}$$

$$\text{Maximum Allowable Tension} = 1220 \text{ lbs}$$

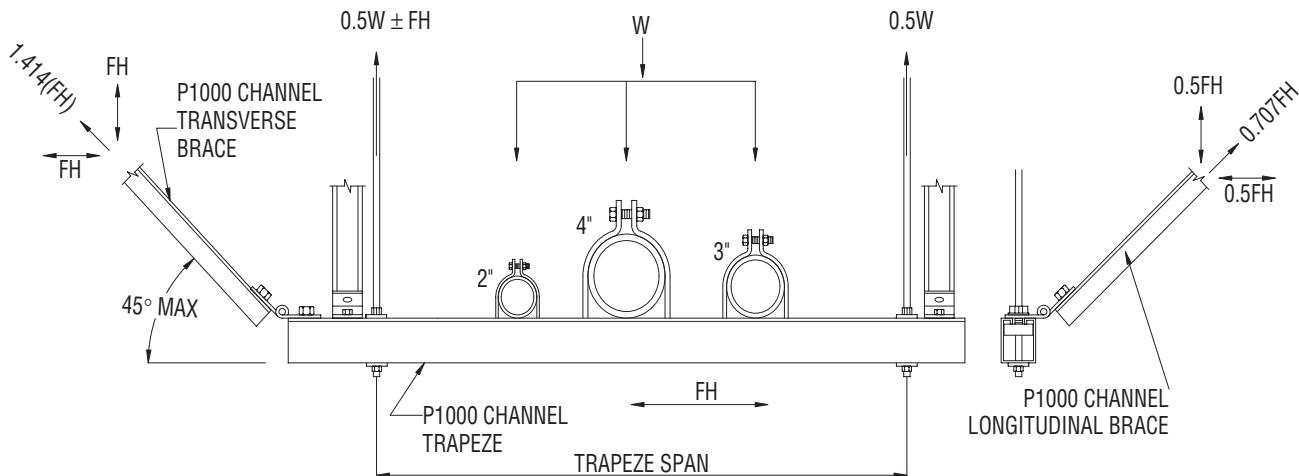

$$i = \left(\frac{358}{952} \right)^{\frac{5}{3}} + \left(\frac{506}{1220} \right)^{\frac{5}{3}} = 0.43 \leq 1.0, \text{ Therefore okay.}$$

For Shallow Anchors, $F_{h(SA)} = 2F_h$. Therefore, double the seismic load (F_h) and repeat Steps 4 through 8.

APPROVED Fixed Equipment Anchorage Office of Statewide Health Planning and Development OPA-0120 Apr 25, 2003  **** Valid for 3 Years Maximum ****  Bill Staehlin (916) 324-9106	 JOSEPH L. LA BRIE Structural Engineer No. SE 3566 55 E. Walnut St. Suite 277 Arcadia, CA 91006 	UNISTRUT® 35660 Clinton Street Wayne, Michigan 48184 PH: (800) 521-7730 FAX: (734) 721-4106 DATE: 04/25/2003 PAGE 7-3
---	--	--

**Problem:**

Trapeze hanger spanning 24" hung from rods with a seismic brace to be used on left end (see figure below). There is one 2" diameter pipe, one 3" pipe, and one 4" pipe with the load evenly distributed on the trapeze.

**Solution:**

Step 1 (Page 2-3) Determine the Trapeze Spacing (S) using the smallest pipe diameter.

$$\text{For 2" Diameter: } S = 10 \text{ ft}$$

Step 2 (Page 2-3) Calculate the weight of the pipes plus contents (W) on each trapeze.

$$W = S \times (p_1 + p_2 + p_3) = 10 \text{ ft} \times (5.11 + 10.78 + 16.31) \text{ lbs/ft} = 322 \text{ lbs}$$

Step 3 Calculate horizontal seismic force (F_H) assuming braces on *alternate trapeze supports*

If pipe placed above ceiling of 2nd floor (20 ft) of a 4 story (40 ft) building and is within the seismic limits defined in page 1-1, then C_s can be taken from Page 1-1, Seismic Design Coefficient Graph:

$$\begin{aligned} h_x &= 20' \\ h_r &= 40' \\ h_x/h_r &= 0.5 \end{aligned}$$

$$\begin{aligned} s &= 0.83 \\ (\text{within } 0.693 \leq C_s \leq 3.96) \end{aligned}$$

$$\begin{aligned} F_H &= C_s(2W) = 0.83 \times 2 \times 322 \text{ lbs} = 535 \text{ lbs} \\ F_h &= F_H/1.4 = 535 \text{ lbs}/1.4 = 382 \text{ lbs} \end{aligned}$$

(brace on alternating trapeze)
(converts to working stress loads)

APPROVED Fixed Equipment Anchorage Office of Statewide Health Planning and Development OPA-0120 Apr 25, 2003 **** Valid for 3 Years Maximum **** Bill Staehlin (916) 324-9106	makeitright JOSEPH L. LA BRIE Structural Engineer No. SE 3566 55 E. Walnut St. Suite 277 Arcadia, CA 91006 DATE: 04/25/2003	UNISTRUT® 35660 Clinton Street Wayne, Michigan 48184 PH: (800) 521-7730 FAX: (734) 721-4106 PAGE 7-4
---	---	--

Step 4 Actual Brace Force (maximum at 45°):

$$F_{b \text{ Actual}} = 1.414(F_h) = 1.414(382 \text{ lbs}) = 540 \text{ lbs}$$

Step 5 Select fitting P1843W from Page 4-7 & check slip along channel:

From Page 4-5 (Design Load Table), the maximum slip resistance for a single bolt fitting P1843W is 1,500 lbs and is greater than $F_{b \text{ Actual}}$. Therefore O.K.

Check brace against allowable design load:

From Page 4-6 (Brace Design Table), the maximum brace span that can be used is 120", which yields a capacity of 1,200 lbs and is greater than $F_{b \text{ Actual}}$. Therefore O.K.

Can use any brace length less than 120".

The limiting allowable load is the Brace Design Load. Therefore $F_{b \text{ Allow.}} = 1,200 \text{ lbs.}$

Determine if **longitudinal** braces are required:

$$\begin{aligned} \text{Brace Spacing (# of bays)} &= F_{b \text{ Allow.}} / (0.5F_h) \\ &= 1200 \text{ lbs} / (.5 * 382 \text{ lbs}) \\ &\approx 6 \text{ bays} \end{aligned}$$

Determine if **transverse** bracing is required:

$$\begin{aligned} \text{Brace Spacing (# of bays)} &= F_{b \text{ Allow.}} / (F_h) \\ &= 425 \text{ lbs} / (382 \text{ lbs}) \\ &\approx 3 \text{ bays} \end{aligned}$$

Therefore provide Transverse Brace at every other hanger and Longitudinal Brace at every other Transverse Brace.

Step 6 Check compression and tension forces in the rod with brace on alternate hangers.

a. $T_{\max} = 0.5W + F_h = .5(322) + 382 = 543 \text{ lbs}$

(Page 3-11, Threaded Rod Table) A 3/8" rod will carry a Seismic Load of 810 lbs, which is greater than T_{\max} . Therefore is acceptable.

b. $C_{\max} = 0.5W - F_h = .5(322) - 382 = -221 \text{ lbs}$

Check buckling due to compression by determining the percentage of full stress capacity:

$$C_{\max} / C_{\text{Allowable}} = 22/1810 = 0.27$$

(Page 3-10, Channel Stiffener Table) Since 27% is less than 50%:

Use P1000T stiffener with P2485 clips spaced 14" on center.

APPROVED

DATE:

04/25/2003

PAGE
7-5

Step 7 Select clamps from Pages 3-3 & 3-4.

Style P1100 series or P2558 series can be used.

Check P1121 clamp against transverse and longitudinal seismic forces.

(Reference Page 2-3, Pipe Data Table) Use largest pipe – 4" diameter:

Transverse Force = $16.31\text{lbs}/\text{ft} \times 10\text{ft} \times 0.83/1.4 = 97\text{ lbs}$

Longitudinal Force = $16.31\text{lbs}/\text{ft} \times 20\text{ft} \times 0.83/1.4 = 194\text{ lbs}$

From Page 3-3, *allowable transverse force* is $320 \times 1.33 = 425\text{ lbs}$

Transverse force (97 lbs) is less than allowable (425 lbs), **therefore okay.**

From Page 3-3, *allowable longitudinal force* is $200 \times 1.33 = 266\text{ lbs}$

Longitudinal force (194 lbs) is less than allowable (266 lbs), **therefore okay.**

Step 8 (Page 3-1) Select a trapeze member.

A P1000 spanning 24" will carry 1690 lbs, which is greater than the calculated W=322 lbs (from Step 2).

Step 9 Check combined vertical and lateral bending using interaction formula given on Page 2-2
(Using a P1000 with 24" span, get allowable loads from Page 4-4, Beam Load Table):

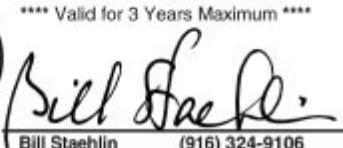

$$\frac{322}{0.92 \times 1690} + \frac{382}{0.92 \times 2430} \leq 1.33$$

$0.207 + 0.169 = 0.38 \leq 1.33$ Therefore O.K.

Step 10 Select anchors/connection.

(Pages 5-2 through 5-4) For steel structure attachments, select P1649AS with $\frac{3}{8}$ " rod.

Design Load = 650 lbs > T_{max}. Therefore okay.

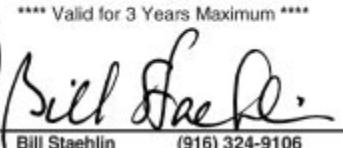

<div style="border: 1px solid black; padding: 10px; text-align: center;"> APPROVED Fixed Equipment Anchorage Office of Statewide Health Planning and Development OPA-0120 Apr 25, 2003  **** Valid for 3 Years Maximum ****  Bill Staehlin (916) 324-9106 </div>	UNISTRUT® 35660 Clinton Street Wayne, Michigan 48184 PH: (800) 521-7730 FAX: (734) 721-4106  JOSEPH L. LA BRIE Structural Engineer No. SE 3566 55 E. Walnut St. Suite 277 Arcadia, CA 91006  DATE: 04/25/2003 PAGE 7-6
---	---

The following defines the design seismic force (F_p) as described in the 2000 International Building Code (I.B.C.). The engineer of record shall qualify for the calculation of the seismic force as needed. This sheet provided for reference only.

$$F_p = \frac{0.4a_p S_{DS} W_p}{\frac{R_p}{I_p}} (1 + 2 \frac{z}{h})$$

- a_p = Component amplification factor:
(Table 1621.3, 2000 IBC)
- I_p = Component importance factor:
(Section 1621.1.6, 2000 IBC)
- h = Average roof height of structure relative to the base elevation
- R_p = Component response modification factor:
(Table 1621.2 or 1621.3, 2000 IBC)
- S_{DS} = Design spectral response acceleration at short period:
(Section 1615.1.3 or $S_{DS} \approx 2.5C_a$, 2000 IBC)
- z = Height in structure at point of attachment of component.

Limits to lateral seismic force: $0.3 S_{DS} I_p W_p \leq F_p \leq 1.6 S_{DS} I_p W_p$

* Maximum weight equals weight of rigid conduit plus weight of heaviest conductor combination (from the National Electrical Code Handbook).

Nominal Pipe Size in	Max. Span ft (m)	Nominal Pipe Size in	Max. Span ft (m)
1	7 2.13	8	19 5.79
1 1/2	9 2.74	10	22 6.71
2	10 3.05	12	23 7.01
2 1/2	11 3.35	14	25 7.62
3	12 3.66	16	27 8.23
3 1/2	13 3.96	18	28 8.53
4	14 4.27	20	30 9.14
5	16 4.88	24	32 9.75

The above spacing based on a combined bending and shear stress of 1500 PSI when pipe is filled with water and the pitch of the line is such that a sag of 0.1in. between supports is permissible.

Conduit Supports

Supports: Rigid metal conduit shall be installed as a complete system as provided in Article 300 and shall be securely fastened in place. Conduit shall be firmly fastened within 3 feet (914 mm) of each outlet box, junction box, cabinet, or fitting. Conduit shall be supported at least every 10 feet (3.05m).

Exception: If made up with threaded couplings, it shall be permissible to support straight runs of rigid metal conduit in accordance with Table 346-12, provided such supports prevent transmission of stresses to termination where conduit is deflected between supports.

Table 346-12
Support for Rigid Metal Conduit

Conduit Size in (mm)	Maximum Distance Between Supports ft (m)
1/2 - 3/4	10
12.7 - 19.1	3.05
