Outline

- 1 Polarized Deep Inelastic Scattering
- 2 What is d_2^n ?
- 3 The E06-014 Experiment
 - Setup and Kinematics
 - Polarized Electron Beam
 - Polarized ^3He Target
 - Physics Measurements
- 4 Preliminary Results
 - Cross Sections
 - Asymmetries
 - Projected Error on d_2^n
- 5 Summary

Polarized DIS

- Scatter longitudinally-polarized electrons off of a longitudinally (or transversely) polarized nucleon
- They interact via an exchanged **virtual photon**
- Probes the spin content of the nucleon
- We measure physics observables like the electron's **scattering cross-section** and **asymmetries**

What is d_2^n ?

The Lorentz Color Force

- A virtual photon probes inside the nucleon and strikes a quark
- The active quark in the interaction feels a **force** due to the spectator constituents
- d_2^n is a measure of this transverse **Lorentz color force** (M. Burkardt, hep-ph/0905.4079v1)

The E06-014 Experiment Setup

The E06-014 Experiment

Kinematic Coverage

Kinematic Coverage

The E06-014 Experiment

Electron Beam Polarization

- Two methods: Møller and Compton measurements
- Combine both methods to achieve an error of $\sim 1.6\%$

Figure: Compton data analysis by D. Parno. Plot from D. Parno's thesis.

The E06-014 Experiment

^3He Target Polarization

- NMR measurement every four hours (target chamber)
- EPR at every spin rotation (pumping chamber)
 - EPR calibration: achieve an error of $\sim 4.9\%$

Figure: Target polarization analysis by Y. Zhang.

The Measurement of d_2^n

- Combine our measured **cross-sections** and **asymmetries**:

$$d_2^n = \int_0^1 dx \frac{MQ^2}{4\alpha^2} \frac{x^2 y^2}{(1-y)(2-y)} \sigma_0 \times \left[\left(3 \frac{1 + (1-y) \cos \theta}{(1-y) \sin \theta} + \frac{4}{y} \tan(\theta/2) \right) A_{\perp} + \left(\frac{4}{y} - 3 \right) A_{\parallel} \right]$$

$$A_{\parallel} = \frac{\sigma^{\downarrow\uparrow} - \sigma^{\uparrow\uparrow}}{\sigma^{\downarrow\uparrow} + \sigma^{\uparrow\uparrow}} \quad A_{\perp} = \frac{\sigma^{\downarrow\Rightarrow} - \sigma^{\uparrow\Rightarrow}}{\sigma^{\downarrow\Rightarrow} + \sigma^{\uparrow\Rightarrow}} \quad \sigma_0 = \frac{ps \cdot N}{(Q/e)\rho t_{LT}\varepsilon} \frac{1}{w\Delta E'\Delta\Omega\Delta Z}$$

$\uparrow, \downarrow = e^-$ beam spin $\uparrow, \Rightarrow =$ Target spin

LHRS Analysis (1)

$E = 4.73$ GeV Data: Cross Sections

^3He Cross Section ($E = 4.73$ GeV, $\theta = 45^\circ$)

Figure: Cross section analysis by D. Flay.

LHRS Analysis (2)

$E = 5.89$ GeV Data: Cross Sections

^3He Cross Section ($E = 5.89$ GeV, $\theta = 45^\circ$)

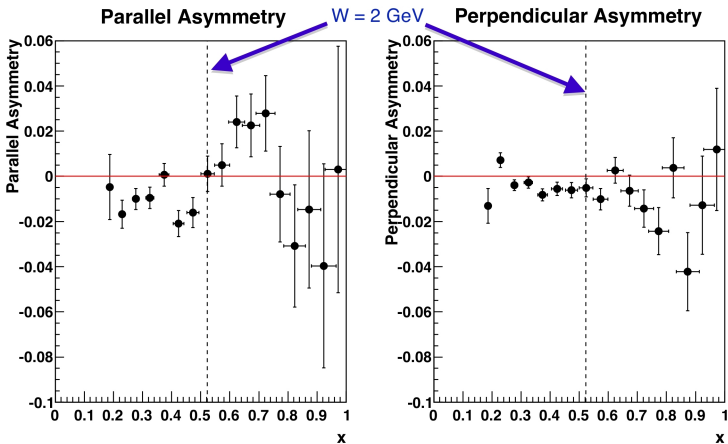

Figure: Cross section analysis by D. Flay.

BigBite Analysis (1)

$E = 4.73$ GeV Data: A_{\parallel} and A_{\perp}

Includes both statistical and systematic errors. No radiative or pair-production corrections.

Figure: Asymmetry analysis by D. Parno and M. Posik. Plots from D. Parno's thesis.

BigBite Analysis (2)

$E = 4.73$ GeV Data: $A_1^{3\text{He}}$

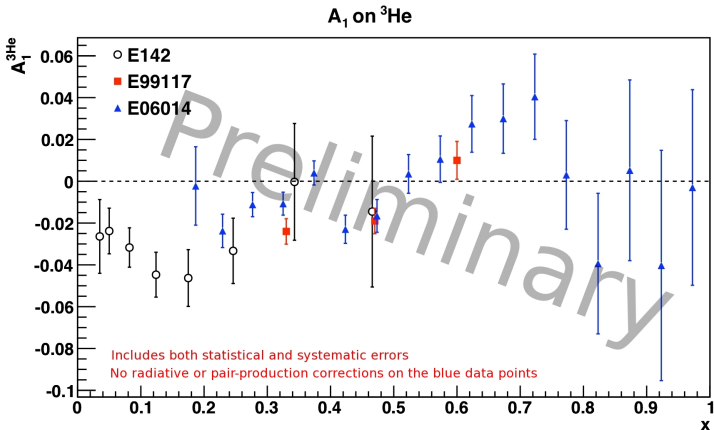

Figure: Asymmetry analysis by D. Parno and M. Posik. Plot from D. Parno's thesis.

Projected Error on d_2^n

Comparison to Current Data

- Projected statistical error: $\sim 5 \times 10^{-4}$
 - Four times better than current world average
 - Direct test of Lattice QCD

Summary

- Interested in **quark-gluon correlations**
 - Exploit transverse **spin interactions** through the g_2 structure function, leading to higher twist effects seen in the matrix element d_2^n
 - Sheds light upon the **Lorentz color force** inside the nucleon
- Preliminary results for $A_1^{3\text{He}}$ are in good agreement with the JLab E99-117 result and provides more complete kinematic coverage with more data points and better statistics
- Our calculation of d_2^m will provide a benchmark test for Lattice QCD

Current and Future Work

- Radiative corrections to the cross section and asymmetry data, including finishing up the positron dilution calculations
- Computing the asymmetries for the primary (E = 5.89 GeV) data set
- Extracting the asymmetry A_1^n , $d_2^{3\text{He},n}$ and the spin structure functions $g_1^{3\text{He},n}$, $g_2^{3\text{He},n}$

Acknowledgements

- Thanks to the spokespeople X. Jiang, S. Choi, B. Sawatzky, and Z.-E. Meziani.
- Thanks to P. Solvignon, K. Slifer, V. Sulkosky, C. Dutta, K. Allada, and the rest of the d_2^n , Transversity and the Hall A Collaborations, and the Hall A Staff at Jefferson Lab for their advice, suggestions, and continued support.
- Thank you to Temple University and Carnegie Mellon University.

Backup (1)

^3He Target

- Vaporized Rb is optically pumped using circularly polarized light to polarize its electrons
- Through **hybrid spin-exchange** the Rb electrons transfer their spin to K atoms, then K to ^3He nuclei

Backup (2)

Physics Measurements

- The spin structure functions:

$$g_1 = \frac{MQ^2}{4\alpha^2} \frac{2y}{(1-y)(2-y)} \sigma_0 [A_{\parallel} + \tan(\theta/2) A_{\perp}]$$

$$g_2 = \frac{MQ^2}{4\alpha^2} \frac{y^2}{(1-y)(2-y)} \sigma_0 \left[-A_{\parallel} + \frac{1 + (1-y) \cos \theta}{(1-y) \sin \theta} A_{\perp} \right]$$
