

- Raw APV data has strips counting right to left.
- On a backplane adc 0,1,2,3 ect counts right to left, except for 12 slots which count left to right.
- Pos – This is how you tell the analysis to convert the adc ID location to the location in real space.
- Invert – If you are counting a backplane left to right then invert needs to be 1, so the strips inside an APV count left to right instead of right to left.
