

MOLLER_12GeV Shielding Update

Rakitha Beminiwattha

Simulation Status

All the collimators are Tungsten

All the shielding enclosures are Borated Concrete

09/18/14

Rakitha Beminiwattha

Simulation Status

- Simulation done using 11 GeV electron beam on 150 cm hydrogen target
- Current simulation do not have the hall A enclosure included
 - Will add from now on
- Detectors used
 - Cylindrical detector at the hall radius with same height as the hall → This is same as PREX “Hall Detector” or “Cylin. Detector”
 - Two disk detectors at top and bottom of the cylindrical detector → “Top” and “Bottom” detector

Current Status of Shielding

Only comparing cylindrical detector "Hall Detector"					
		MOLLER N/Shield	MOLLER W/Shield	PREX_I	PREX_II

Current Status of Shielding

- For MOLLER, our main issue is high energy neutrons ($E > 10$ MeV)
 - High energy $e^\pm$ and γ are also an issue
- Low energy neutrons ($E < 10$ MeV) are at about same level as PREX and we could manage it by using polythene/boron/water to same or below the levels of PREX-II
- Material and size optimization for shielding are not done so far
- There are gains in optimizing collimator design
 - Bore radii and shapes (flat or tapered)
 - Col-1 and Col-3 optimization

Radiation by Vertex Region

- Radiation by vertex region can be extracted by using a z direction range cut on particles crossing detectors (Cylin., Top, and Bottom)
- Only used z direction range cut and no xy plane cuts
 - All radiation from selected z direction range is included → This can include secondary radiation generated from the shielding itself

Radiation by Vertex Region : Power

- “Other” definition : Vertices not from Target, Col-1, Col-2, Col-3, Col-4, and Col-5
- Due to introduction of shielding, contribution to the total has dropped from Target, Col-1, Col-2, Col-3, Col-4, and Col-5
 - The shielding has also introduced additional radiation seen at increase in “Other”

Radiation by Vertex Region : Flux

	100<E	1.94	51.39	19.26	21.33	2.69	0.55	2.83	100.0

- “Other” definition : Vertices not from Target, Col-1, Col-2, Col-3, Col-4, and Col-5
- Due to application of shielding contribution to the total has dropped from Target, Col-1, Col-2, Col-3, Col-4, and Col-5

Summary

- Material and size optimization for shielding is not complete so far
- There are gains in optimizing collimator design
 - Bore radii and shapes (flat or tapered)
- Col-1 and Col-3 optimization
 - Move Col-3 into the shielding enclosure and this will further reduce the contribution to the total radiation (see slides : 11 and 13)
- Need further investigation into “Other” regions in the Moller setup and minimize the radiation

More Detailed Plots

Radiation by Vertex Region

- Radiation by vertex region can be extracted by using a z direction range cut on particle crossing a detectors
- Only used z direction range cut and no xy plane cuts
 - All radiation from selected z direction range is included → This can include secondary radiation generated at the shielding

Neutron from Col-3 Area in 100<KE MeV Range

Radiation by Vertex Region

- Collimators 1 and 3 takes the most power hence generate more radiation
- Collimators 2, 4 and 5 generate less radiation
- Due to interaction from shielding materials collimator 5 has increased radiation after shielding
