Matthew Posik (Temple University)

# Probing QCD through Quark-Gluon Dynamics

### $d_2^n$ gives access to quark-gluon correlations

$$d_{2}^{n} = \int_{0}^{1} x^{2} \left( 2g_{1} \left( x, Q^{2} \right) + 3g_{2} \left( x, Q^{2} \right) \right) dx$$

- What is  $d_2^n$ ?
  - Average Lorentz color transverse force acting on a quark immediately after being struck by a virtual photon (M. Burkardt)

Jefferson Lab

October 25, 2012

2 / 24

•  $d_2^n$  is dominated by large x contributions

Matthew Posik (Temple University)

**Physics Motivation** 

# What is $d_2^n$ ?

E06-014: October 2012 DNP

3 / 24 October 25, 2012

3

# What is $d_2^n$ ?

So  $d_2^n$  is...

### • A measure of quark-gluon correlations

Matthew Posik (Temple University)

# What is $d_2^n$ ?

- A measure of quark-gluon correlations
- A force felt between the quark and gluon due to a virtual photon knocking a quark out of the nucleon

Matthew Posik (Temple University)

# **Experimental Set-Up**

- Scattered longitudinally polarized electrons from longitudinally/transversely polarized <sup>3</sup>He target
- Two single arm detectors position 45° relative to the beam line

October 25, 2012

5 / 24

Matthew Posik (Temple University)

## **Kinematic Coverage**

**Kinematic Coverage** 

• 0.2 < x < 0.925•  $2 < Q^2 < 7 \text{ GeV}^2$ 

Τ

Jefferson Lab

### $d_2^n$ can be measured through the total cross section and the asymmetries

$$A_{\perp} = \frac{\sigma^{\downarrow\uparrow\uparrow} - \sigma^{\uparrow\uparrow\uparrow}}{2\sigma_0}, A_{\parallel} = \frac{\sigma^{\downarrow\Rightarrow} - \sigma^{\uparrow\Rightarrow}}{2\sigma_0}$$

$$d_{2}^{n} = \int_{0}^{1} dx \left( \frac{MQ^{2}}{4\alpha^{2}} \frac{x^{2}y^{2}\sigma_{0}}{(1-y)(2-y)} \right) \left[ \left( 3\frac{1+(1-y)\cos\theta}{(1-y)} + \frac{4}{y}\tan\frac{\theta}{2} \right) A_{\perp} + \left( \frac{4}{y} - 3 \right) A_{\parallel} \right]$$

- $\downarrow,\uparrow$  = minus, plus electron helicities
- $\uparrow$ ,  $\Rightarrow$  = down stream, towards BigBite detector

### Summary

- Exploit transverse spin interactions through g<sub>2</sub> structure function, to study higher twist effects
- Gain insight of Lorentz color force inside the neutron through the matrix element d<sup>n</sup><sub>2</sub>
- Provide a test to lattice QCD
- Born Cross-sections are finalized
- Radiative corrections to asymmetries are underway
- BigBite simulations also well underway

 Thanks to ...

## **Pion Asymmetry Contamination**

- Pion asymmetries are sizable
- But pion rejection was good  $\approx 10^5$
- Leads to negligible pion contamination
