- 1 Helicity Sign
- 2 Rescattered Particles: E-p Outliers
- 3 Preshower-Track Alignment
- 4 Good Electrons Without Čerenkov
- 5 Čerenkov Cuts in Production Data
- 6 Summary
- 7 What's Next?

Helicity Sign

- We want to be sure of our helicity sign when computing asymmetries
- Two approaches
 - ▶ Measure known asymmetry (e.g. ^3He elastic scattering)
 - ▶ Check with other experiments of same configuration
- We had two DAQs
- I checked their relative helicity signs during coincidence running
- LHRS and BB have the same sign

Rescattered Particles (i): Setting a Cut

- We can remove many rescattered particles by placing a cut on horizontal bend plane position
- If we project to the plane where the scattering starts, can we define a cleaner cut?
- What plane should we use?

Rescattered Particles (ii): Setting a Cut

- Choose a plane 0.23 m downstream from bend plane
- A plot of projected E-p outlier positions lets us choose a cut:

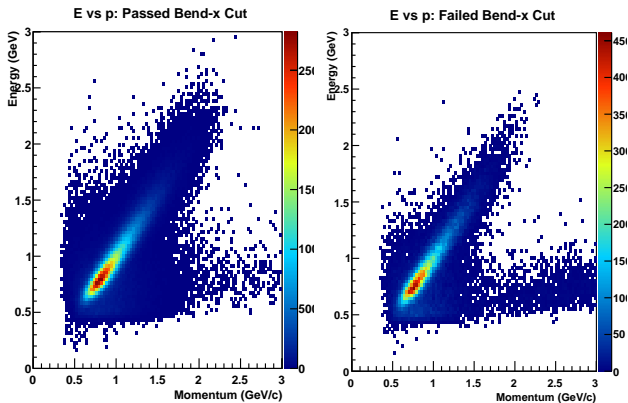

```
(BB.optics.bendx + 0.23*BB.tr.ph)>-0.097 &&  
(BB.optics.bendx + 0.23*BB.tr.ph)<0.13
```

E-p Outlier Cut: Horizontal Position Projected from Bend Plane

Rescattered Particles (iii): Evaluating the Cut

- The projected-position cut rejects 9.1% of tracks with a reasonable E/p
- This compares favorably to original bend-x cut (12.6%)

Rescattered Particles (iv): Evaluating the Cut

$(\text{BB.optics.bendx} + 0.23 \cdot \text{BB.tr.ph}) > -0.097$ && $(\text{BB.optics.bendx} + 0.23 \cdot \text{BB.tr.ph}) < 0.13$

Preshower-Track Alignment (ii)

- Matt did the hard work of extracting the preshower position (in detector coordinates) a while back
- Here's where I've set my alignment cuts for the following study:

`TMath::Abs(BB.tr.x[]+0.97*BB.tr.th[]-BB.ts.ps.x-0.0078)<0.2`

`TMath::Abs(BB.tr.y[]+0.97*BB.tr.ph[]-BB.ts.ps.y-0.01)<0.19`

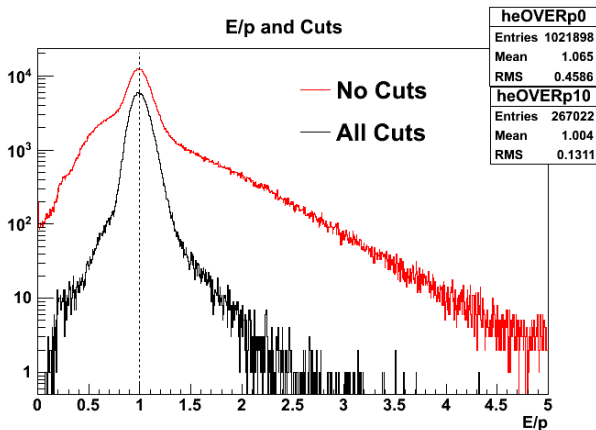

Preshower-Track Alignment (i)

$\text{TMath::Abs}(\text{BB.tr.x}[] + 0.97 * \text{BB.tr.th}[] - \text{BB.ts.ps.x} - 7.8303e-3) < 0.2 \ \&\& \ \text{TMath::Abs}(\text{BB.tr.y}[] + 0.97 * \text{BB.tr.ph}[] - \text{BB.ts.ps.y} - 0.01) < 0.19$

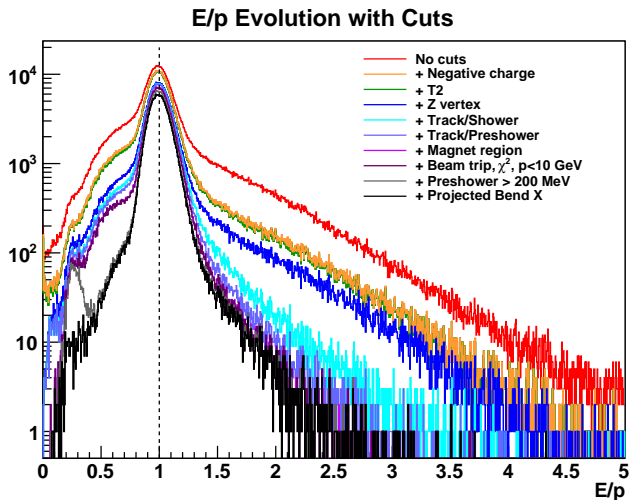

Good Electrons Without Čerenkov (i)

- What does our sample look like with all our non-Čerenkov cuts?
- Let's plot E/p for a sample run
- 26.1% of tracks survive full set of cuts

Good Electrons Without Čerenkov (ii)

- We can also look at the change in E/p from turning on one cut at a time:

Good Electrons Without Čerenkov (iii)

- $E - p$ plots show that the cuts look the same from a slightly different perspective:

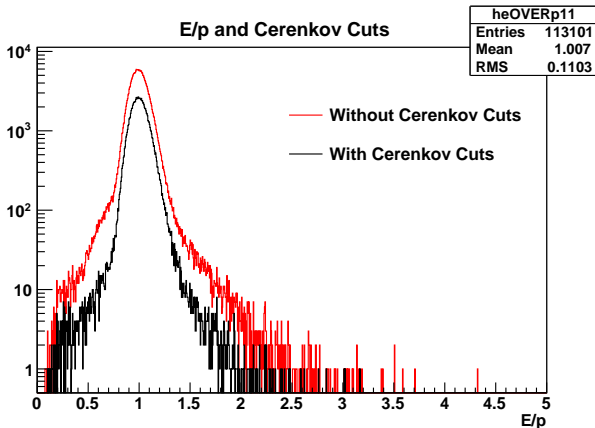

Production Čerenkov Cuts (i)

- The Čerenkov cut for each PMT has four elements
 - 1 Did the TDC record any hits?
 - 2 **AND** If so, were they within the right timing window?
 - 3 **AND** Was the ADC level high enough for an electron signal?
 - 4 **AND** Did the track intersect with the right mirror?
- The total Čerenkov cut is formed **OR**ing all PMT cuts together
- Matt's Čerenkov cuts are very tight
- 42.4% of tracks from pre-Čerenkov cut survive Čerenkov cut

Production Čerenkov Cuts (ii)

- We're throwing out too many statistics for production analysis
- Most of this is due to the track-mirror alignment cut

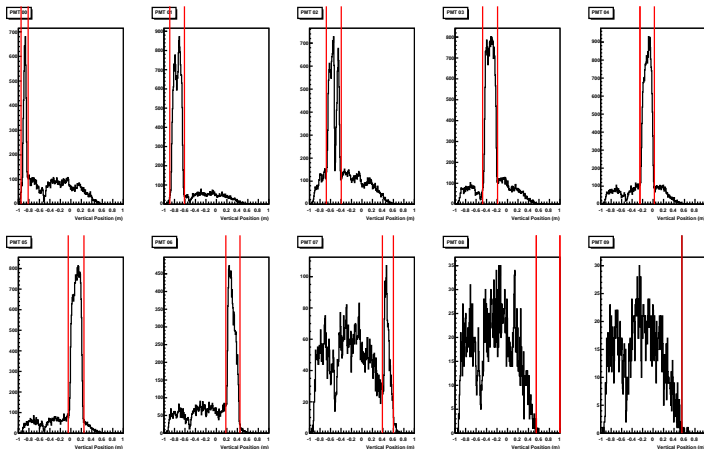

Production Čerenkov Cuts (ii)

- Let's redo the mirror cuts with the TDC information Matt has recently finalized
- When a particular PMT fires, what's the track x position?

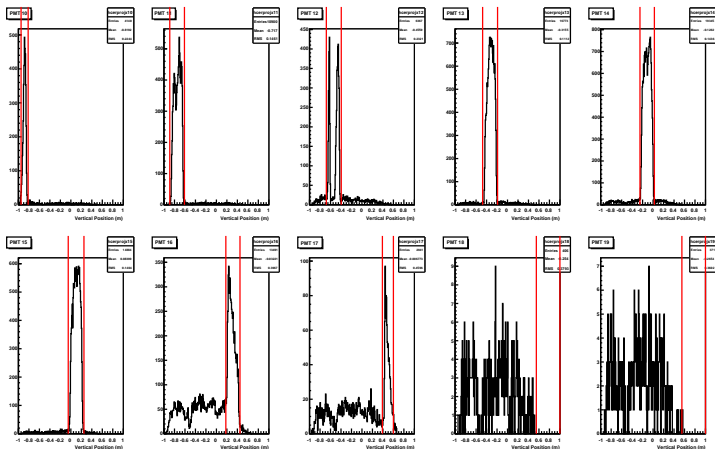

Production Čerenkov Cuts (iii)

- Place a loose cut around the x peak for each PMT

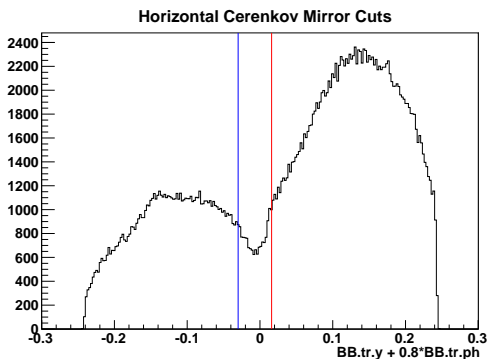

Production Čerenkov Cuts (iv)

- The same cuts also work for the RHRS side

Production Čerenkov Cuts (v)

- On the horizontal side, we have much less resolution
- We need to allow overlap between the two columns

Production Čerenkov Cuts (vi)

- The new track/mirror alignment cut has a much larger acceptance (left)
- Now, 65.9% of previously accepted tracks survive Čerenkov (right)
- How much of each distribution passes a loose E/p cut?
 - ▶ Pre-Čerenkov cut: 95.8%
 - ▶ Post-Čerenkov cut: 97.2%

Summary

- LHRS and BB have same helicity sign
- Best to cut out E-p outliers via a projected-bendx cut
- Preshower/track alignment cleans up our sample
- No nasty surprises are apparent in E/p spectrum
- (Indeed, not much background is apparent there, either)
- I have loosened geometrical Čerenkov cuts and some mirror overlap is allowed

What's Next?

- Cuts
 - ▶ Loosen Čerenkov ADC cuts?
 - ▶ Čerenkov cut consistency
 - ▶ Confirm times of HWP switches
- Asymmetries
 - ▶ Elastic ^3He asymmetry to check sign
 - ▶ Asymmetry on particles that scattered from pole piece
 - ▶ Asymmetry on new good electron sample
- Compton
 - ▶ Continue quantifying systematic errors, especially on P_γ
 - ▶ Produce single P_e for each run period
- Dissertation
