

We realized I had made a number of mistakes on old version of this plot:

- no inelastic radiative corrections
- improper dilution used
- baked unnecessary scale factor into data file
- new scale factor when these are fixed is 1.142

View previous version of this plot as completely incorrect.

Though ratio isn't flat and beautiful with these
Fixed, the clear systematic effect on the delta is gone
On average, we are back to about a 12% scatter if
we went with that method
